Control measure – Emergency call supervision..... 64
Control measure – Hold debriefing or post-incident reviews 65

National
Operational
Guidance

Fire control command guidance

Fire Control Command 1.0 Full consultation

June 2021

2 Introduction

3 This guidance has been produced to help fire and rescue services ensure appropriate arrangements
4 are in place for the strong and resilient leadership of fire control incident command.

5 Responding to incidents can be hazardous and stressful. To ensure a successful conclusion, an
6 efficient fire control working in conjunction with the incident ground is essential. Effective
7 information gathering, strong leadership, critical decision making and proportional and swift action
8 by both fire control personnel and incident commanders ensure an effective conclusion of the
9 situation. Some incidents need only simple actions and procedures as risks are low. Others can be
10 more challenging and may quickly increase in size, complexity and duration. A resilient and skilled
11 fire control that can dynamically adapt is essential to ensure the safe resolution of the incidents to
12 which the fire and rescue service is called.

13 Fire and rescue authorities must plan for health and safety in the fire control environment in order
14 to fulfil their legislative and regulatory duties. The application of risk assessment and control
15 measures should not prevent the delivery of fire control room functions.

16 Three other sections of National Operational Guidance should also be considered during incidents:
17 business continuity, emergency call management and multi-agency.

18 **The incident command system and the role of fire control commanders**

19 In extending the incident command system and its operational, tactical and strategic levels of
20 command to fire control, fire and rescue services are provided with a method of ensuring robust
21 command of the fire control function.

22 The incident command system is an all-hazards approach, providing a progressive, scalable and
23 flexible system of command, control and organisation. Using the system will help fire control
24 commanders manage and fulfil their plans for the safe and efficient delivery of all activities of the
25 fire control function. It encourages a controlled and systematic approach to managing incidents and
26 situations in fire control.

27 The fire control commander is the person responsible for the management of the activity of the fire
28 control function. This role is normally carried out by a supervisory manager. Responsibility for tasks
29 and actions may be delegated to another suitably experienced person, however overall responsibility
30 cannot be delegated.

31 Fire and rescue services should decide the level at which the fire control command function is
32 carried out, and in doing so should consider the provision of fire control command at operational,
33 tactical and strategic levels, ensuring appropriate selection and development processes are in place.

34 The fire control manager is the person responsible for the overall management of the fire control
35 function and they may fulfil a command role in line with tactical or strategic incident command.
36 Where this is the case fire and rescue services should ensure that command competence, training,
37 accreditation, and revalidation appropriate to this level is achieved and maintained. The fire control
38 manager may also maintain additional tactical adviser skills, for example Communications Tactical
39 Advisor or National Inter-agency Liaison Officer. In doing so enhanced resilience may be achieved

40 during complex situations, multi-agency or major incidents.

41 Fire control workloads can vary widely with the competing demands of operational incidents. The
42 fire control function is required to manage its workload and support operational incidents across all
43 types and contexts including:

- 44 • Single incident
- 45 • Multiple incidents
- 46 • Multiple calls
- 47 • Spate conditions, for example during wildfires, widespread flooding and other extreme
48 weather conditions
- 49 • Major incidents
- 50 • Planned major events

51 This list is not exhaustive and any of these situations may happen simultaneously. In addition to the
52 core function of emergency call management, response mobilisation and the provision of
53 operational response support, fire control may manage other activities to support the day-to-day
54 functioning of the fire and rescue service. This requires the fire control commander to be proactive
55 and dynamic in their approach to the command of the fire control function and the management of
56 tasks and actions.

57 The critical nature of decision-making skills required when fire control commanders manage
58 emergency call handling requires the ability to cope with stressful situations under sustained
59 pressure, for example when overseeing and managing:

- 60 • The provision of life-saving advice
- 61 • The mobilisation of resources
- 62 • Support to an incident
- 63 • Multiple calls
- 64 • Multiple incidents
- 65 • Complex incidents or situations

66 Fire control command can involve the management of simultaneous incidents and situations. This
67 additional complexity means that it is essential that command competence, skills, selection, training
68 and revalidation processes are applied to fire control commanders.

69 The key components of the incident command system include:

- 70 • Clear, defined and visible lines of command
- 71 • Manageable spans of control
- 72 • A communications infrastructure
- 73 • Appropriate responsibility and authority

- 74 • Clearly defined and understood roles and responsibilities

75 It is the role of the fire control commander to effectively and safely manage the fire control function
76 at a tactical level to support the best resolutions to operational incidents and all fire control
77 activities. It is the role of all fire control personnel to be familiar with the requirements of the fire
78 control command structure and know how to operate safely and effectively within it. This applies
79 equally to those who will perform a command role and those who will be operating under the
80 command of others.

81 Incident command and support activities start from receipt of the emergency call in fire control and
82 continue to the conclusion of the incident.

83 Activities in fire control should be well-organised and controlled. All fire control room personnel
84 should understand their responsibilities regarding health and safety and must ensure these policies
85 and procedures are implemented.

86 Fire control commanders should be aware of becoming overburdened and having too broad a span
87 of control and should consider the issues of team dynamics to get the best from the resources
88 available to them. Fire control commanders should be aware of the support that is available to them
89 and how to request it.

90 Fire and rescue services have a responsibility to provide their fire control commanders with the
91 necessary support, training, equipment and resources to effectively apply the incident command
92 system to any incident or a number of incidents in the fire control environment.

93 **Command skills and the role of the fire control commander**

94 The use of command skills by fire control commanders is important to ensure the effective delivery
95 of the fire control function. Command skills complement technical skills and knowledge and
96 understanding of policies and procedures and are essential for the assertive, effective and safe
97 command of fire control.

98 It may be appropriate in some circumstances for a fire control commander to use their command
99 skills, experience and situational awareness to inform their professional judgement and apply
100 dynamic mobilising strategies if appropriate. Dynamic mobilising may include the augmentation of
101 the level of response to an incident prior to the arrival of operational crews. This may be considered
102 where information is being received indicating incident escalation, the need for additional specialist
103 resources or the need for additional resources to assist with access. There may also be occasions
104 where dynamic mobilising strategies are applied to reduce a response. Further information on this
105 subject is included within the Hazard 'Ineffective command of the fire control function'.

106 Command skills are the social, personal and cognitive skills that come under the heading of human
107 factors. They enable fire control commanders to function effectively when in command of activities
108 in the fire control room. The safety-critical command skills are:

- 109 • Leadership
- 110 • Situational awareness

- 111 • Decision-making
- 112 • Interpersonal communication
- 113 • Personal resilience
- 114 • Teamwork

115 The fire control environment can be fast-moving and pressurised. During the early stages of an
 116 incident or situation the fire control commander may need to perform their role with incomplete
 117 information. They should use their knowledge and experience to build their situational awareness of
 118 the incidents and activities that are ongoing and use their command skills proficiently to gather and
 119 interpret information and to plan the use of fire control resources to meet the requirements of
 120 current activity.

121 Fire and rescue services should recognise the importance of fire control commanders having
 122 effective command skills. With good command skills a fire control commander will have the ability to
 123 successfully apply their technical knowledge to command fire control. When performed well, the
 124 effective use of command skills contributes to safe and effective operations.

125 For example, when a fire control commander demonstrates assertive, effective and safe leadership
 126 this may result in others trusting their judgement or competence. This will enhance the
 127 communication, co-ordination and co-operation of fire and rescue service personnel or members of
 128 other agencies.

129 The application of command skills and the implementation of elements of the incident command
 130 system may be regarded equally as control measures to ensure safe and effective incident
 131 command.

132 Fire control commanders should have a range of qualities, and effectively use command skills, to
 133 deal with the wide-ranging nature of incidents. Effective fire control commanders:

- 134 • Are confident and self-aware
- 135 • Are well-trained and competent
- 136 • Are able to effectively build situational awareness
- 137 • Are able to lead, direct and instruct others
- 138 • Can communicate effectively
- 139 • Are able to plan and implement
- 140 • Can apply sound judgement and effective decision-making
- 141 • Are able to adapt to changing and challenging situations
- 142 • Are calm and controlled
- 143 • Are able to instil trust in their team
- 144 • Are able to delegate effectively

145 Fire control commanders should possess the technical knowledge and command skills to underpin

146 their judgements, decisions and behaviours. They should be able to adapt their communication style
147 appropriately in different situations and have the confidence to seek the views of others and
148 consider them when formulating plans.

149 The application of these skills is key to a well-run fire control and the effective management of all
150 fire control activity and will assist incident ground safety and the resolution of incidents. Services
151 should have systems in place to support decision-making in fire control to reduce the risk of human
152 factors affecting safety.

153 The effective practice of these skills is enhanced within a learning culture that encourages
154 empowerment and the acceptance of responsibility. This includes systems and processes to actively
155 monitor the performance of command skills by fire control personnel in training and during all fire
156 control activities.

157 Post-incident reviews and safety event investigations should examine the use of command skills by
158 fire control personnel to highlight the impact of human factors on fire control activity and
159 operational outcomes. Similarly, a service's policies and procedures should be consistent with its
160 approach to fire control command and incident command. Its command ethos should be clearly
161 articulated to help ensure fire control commanders are aware of the service's expectations.

162 **Selection, training and revalidation of fire control commanders**

163 Fire and rescue services should establish robust selection processes to identify suitable personnel to
164 be developed for supervisory roles in fire control. The processes should ensure that people who
165 perform the role of fire control commander are capable of doing so under the expected pressures of
166 fire control activity and can deal with situations where there is sustained pressure and stress.

167 Fire and rescue services should ensure they appropriately train, assess and revalidate their fire
168 control commanders, to ensure they understand and practise the skills they need for the command
169 of fire control. Fire and rescue services should also equip fire control commanders with the
170 knowledge that is required to resolve the full range of foreseeable incidents and activities.

171 **Legislation**

172 Fire and rescue services should assure themselves that all relevant legislation and regulations for
173 their area are considered when developing policies, procedures and training. For further information
174 on this topic refer to National Operational Guidance: Legislation.

175 Legislation and regulations may affect operational and fire control decisions; some of the key pieces
176 for incident command and fire control activity include:

- 177 • [Fire and Rescue Services Act 2004](#)
- 178 • [Fire \(Scotland\) Act 2005](#)
- 179 • [Fire and Rescue Services \(Northern Ireland\) Order 2006](#)
- 180 • [Fire and Rescue Services \(Emergencies\) \(Wales\) Order 2007](#)
- 181 • [Civil Contingencies Act](#)

- 182 • [Civil Contingencies Act \(Contingency Planning\) Regulations](#)
- 183 • [Data Protection Act 2018](#)
- 184 • [Emergency Services \(Obstruction\) Act](#)
- 185 • [Emergency Workers \(Scotland\) Act](#)
- 186 • [Health and Safety at Work Act](#)
- 187 • [Health and Safety at Work \(Northern Ireland\) Order](#)
- 188 • [Management of Health and Safety at Work Regulations](#)
- 189 • [Management of Health and Safety at Work Regulations \(Northern Ireland\)](#)
- 190 • [Human Rights Act](#)
- 191 • [Water Resources Act](#)
- 192 • [Water Environment \(Controlled Activities\) \(Scotland\) Regulations](#)
- 193 • [Water and Sewerage Services \(Northern Ireland\) Order](#)
- 194 • [Police and Criminal Evidence Act](#)
- 195 • [Criminal Procedure \(Scotland\) Act](#)
- 196 • [Police and Criminal Evidence \(Northern Ireland\) Order](#)

197 **PECS Code of Practice**

198 The Public Emergency Call Service (PECS) Code of Practice sets out the methods that are used for
199 passing emergency calls between the call handling agent and the emergency authority. Fire and
200 rescue services should ensure that the content is considered when developing policies, procedures
201 and training for fire control personnel.

202 **Risk management plan**

203 Each fire and rescue authority must develop their strategic direction through their risk management
204 plan. To determine the extent of their services, strategic managers will consider their statutory
205 duties and the foreseeable risk within their area.

206 Work to identify risk and prepare operational plans should consider all stakeholders, including local
207 emergency planning groups and the fire and rescue service risk management plan.

208 Fire and rescue services will decide on the appropriate level of response for the types of calls that it
209 receives. This may be achieved using a task analysis or similar methodology to determine the
210 number and type of resources that will be needed for the safe resolution of incidents and will inform
211 the basis for the pre-determined attendance that is mobilised to incidents by fire control personnel.
212 It is therefore essential that fire control personnel have an understanding of risk management at this
213 level.

214 **Resourcing**

215 As part of their risk management plan each fire and rescue service should consider the resources
216 they need to provide the resilient command of the fire control function.

217 For fire control command the risk management plan may include:

- 218 • The role and level at which the fire control function will be commanded
- 219 • The number of personnel required for the safe and effective command and operation of the
220 fire control function
- 221 • The types of equipment required to support the fire control command function, such as
222 incident logs, call supervision and monitoring facilities and access to communications
223 equipment and appropriate radio talk groups
- 224 • The arrangements for increasing the capacity of the fire control function
- 225 • The arrangements for enhancing the level of command within fire control and the
226 circumstances where this may be required, for example during multiple fire survival
227 guidance situations, major incidents or spate conditions

228

229 **Responsibility of fire and rescue services**

230 Fire and rescue services are responsible, under legislation and regulations, for developing policies
231 and procedures and for providing information, instruction, training and supervision to their
232 personnel about foreseeable hazards and the control measures used to mitigate the risks arising
233 from those hazards.

234 This guidance sets out to provide fire and rescue services with sufficient knowledge about the
235 potential hazards their personnel could encounter when carrying out activities within the fire control
236 function. Fire and rescue services should ensure their policies, procedure and training covers all
237 hazards and control measures contained in this guidance.

238 **Intra-operability and interoperability**

239 Other agencies may base their expectation of the fire and rescue service response to multi-agency
240 incidents on the incident command system contained in this guidance. Therefore, adoption of this
241 guidance will support intra-operability and interoperability.

242 Using common language and components will ensure fire and rescue services can more effectively
243 resolve local, cross-border and national incidents.

244 **Intra-operability**

245 Intra-operability is the ability of a fire and rescue service to work with other fire and rescue services.

246 Clearly defined roles, particularly the specialist roles performed by personnel from dedicated
247 departments such as fire control or hazardous materials, will support intra-operability and the
248 establishment of effective command teams.

249 Risk management plans, and other pre-planning, should consider incidents that may involve working
250 with the resources or assets of other fire and rescue services, or the National Resilience capabilities.

251 **Interoperability**

252 Interoperability is defined as the extent to which organisations can work together as a matter of
253 routine. Multi-agency interoperability is essential for incidents of all sizes.

254 Interoperability is delivered through the Joint Emergency Services Interoperability Principles (JESIP)
255 doctrine. Fire and rescue services should be aware of the aspects of interoperability that exist when
256 identifying, assessing and pre-planning for all incidents they may attend.

257 In addition to the community risk register, personnel have a wealth of local knowledge of risks or
258 potential scenarios that would benefit from a multi-agency response. This information may be
259 contained in Site-Specific Risk Information (SSRI) for example.

260 It is essential that all components of fire and rescue services, including fire control commanders and
261 their teams, operational planning departments and incident commanders, identify and liaise with
262 relevant partner agencies. This ensures that in the event of responding to different incident types, all
263 agencies are fully aware of the assistance available to maximise operational effectiveness.

264 Working together, control rooms start the principles for joint working, playing a vital role in
265 information gathering and the sharing of situational awareness during incidents. Fire and rescue
266 services must ensure that policies, procedures and training for fire control personnel consider JESIP
267 and the Control Room Supporting Principles of the joint doctrine.

268 Fire control commanders should ensure that risk critical information is shared with other emergency
269 control rooms at the earliest opportunity and in accordance with the common agreed principles set
270 out in JESIP so that shared situational awareness can be established.

271 As well as the common agreed principles contained within JESIP, there is a legal framework to share
272 information between responders in an emergency situation. This will generally come from common
273 law for the saving of life or property, the Crime and Disorder Act or the Civil Contingencies Act. There
274 may also be formal information sharing agreements (ISAs) between agencies.

275 **Joint Emergency Services Interoperability Principles (JESIP)**

276 The [Joint Emergency Services Interoperability Principles \(JESIP\) Joint Doctrine: The Interoperability](#)
277 [Framework](#) advocates the use of the M/ETHANE mnemonic for information gathering and sharing
278 between emergency responders, control rooms and other agencies.

279 This mnemonic should be used when passing information between emergency responders, their
280 control rooms and other agencies so that shared situational awareness can be established:

- 281 • Major incident declared?
- 282 • Exact location
- 283 • Type of incident e.g. explosion or building collapse
- 284 • Hazards present, potential or suspected
- 285 • Access – routes that are safe to use
- 286 • Number, type and severity of casualties
- 287 • Emergency services now present and those required

288 The broader principles of intra-operability and interoperability at the pre-incident stage are captured
289 above, and this should be read in conjunction with the Control Room Supporting Principles
290 contained in the JESIP doctrine.

291

292 **Hazard – Ineffective command of the fire control function**

293 *HAZARD KNOWLEDGE*

294 The fire control commander should possess the appropriate technical knowledge and command
295 skills in emergency control room management to underpin their judgements, decisions and
296 behaviours. The absence of these skills and knowledge will have the potential to lead to a lack of
297 situational awareness and may result in inappropriate decision making, failure to ensure the
298 mobilisation of appropriate resources and to communicate critical information with the incident
299 ground and other agencies.

300 Causes of ineffective command may include:

- 301 • Personal factors, such as:
 - 302 ○ Insufficient training
 - 303 ○ Lack of exposure to a wide range of incident types
 - 304 ○ Physiological stress
 - 305 ○ Psychological stress
 - 306 ○ Failure to effectively use a command skill
- 307 • Insufficient, inadequate or incorrect information, for example:
 - 308 ○ Incorrect information being passed to fire control personnel
 - 309 ○ Incorrect information being passed to an incident ground
 - 310 ○ Difficulty in obtaining information from members of the public
 - 311 ○ Difficulty in obtaining information from other agencies
- 312 • Resource factors, such as:
 - 313 ○ Insufficient personnel
 - 314 ○ Insufficient or inadequate equipment or technology
 - 315 ○ Equipment failure
 - 316 ○ Insufficient or inadequate technical support
- 317 • External factors, such as:
 - 318 ○ Size and complexity of incidents
 - 319 ○ Call volumes or multiple incidents
 - 320 ○ Unfamiliar or unconventional incident
 - 321 ○ Moral pressure to act
 - 322 ○ Public pressure to act
- 323 • The working environment, including:
 - 324 ○ Poor ergonomic conditions

325 ○ Unfamiliar working conditions, for example when working in a fallback environment

326 ○ Noise

327 • Organisational factors, including:

328 ○ Ineffective fire control command selection process

329 ○ Inadequate policies and procedures

330 ○ Ineffective development and preparation of fire control commanders

331 ○ Inadequate information management and systems

332 ○ Ineffective operational assurance

333 ○ Ineffective organisational learning processes

334 ○ Inappropriate organisational culture

335 Ineffective command of the fire control function amplifies the potential impact of the hazards
336 present which could result in:

337 • Failure to mobilise appropriate resources

338 • Delays in attendance at incidents

339 The impacts of these could in turn result in:

340 • Harm to people

341 • Harm to communities

342 • Damage to or loss of property

343 • Damage to the environment

344 • Reputational damage

345 • Loss of public confidence

346 **Ineffective leadership**

347 If fire control commanders are unable to effectively lead others it will impact on their ability to:

348 • Command the fire control function safely

349 • Comply with relevant legislation and regulations

350 • Instil confidence

351 • Motivate and inspire others

352 • Collaborate and co-operate effectively with operational personnel and other emergency
353 responders

354 The role of fire control personnel is as risk critical as that of operational personnel. The leadership of
355 a fire control commander is exercised under pressure and may directly influence the effective
356 resolution of incidents.

357

358 **Inaccurate situational awareness**

359 Inaccurate or ineffective situational awareness may lead to fire control commanders potentially
360 overlooking information when they make decisions or implement plans and may delay the sharing of
361 critical information with operational incident commanders and other responding agencies. Some of
362 the factors for this occurring include:

- 363 • The fire control commander being unable to effectively process information
- 364 • The fire control commander being unable to effectively manage information
- 365 • Inaccurate information being provided to the fire control commander
- 366 • A delay in information being provided to the fire control commander
- 367 • Poor or inadequate information provided from an incident ground.
- 368 • Poor communication
- 369 • Lack of co-operation or co-ordination between personnel or other agencies

370 If a fire control commander is unable to obtain and maintain their situational awareness this may
371 affect their ability to:

- 372 • Assess risks
- 373 • Make decisions
- 374 • Develop a plan
- 375 • Devise contingency plans
- 376 • Determine resource requirements
- 377 • Assess the impact to other service activity and the effective operation of the fire control
378 function

379 **Inappropriate decision-making**

380 Decision-making is a complex skill which is influenced by the situations that confront the individual.
381 Some decisions are made rapidly with little or no conscious thought, while others involve a conscious
382 and intensive thought process that compares options and takes time.

383 Different situations may elicit different decision-making strategies. Poor decision-making may lead to
384 a deterioration of the fire control function and may be negatively influenced by inaccurate or
385 ineffective situational awareness, along with other contributory factors.

386 The decision-making skill of fire control personnel is one of the essential components of effective
387 command and control in emergency response. Fire control commanders and the fire control
388 personnel in their teams may have to make critical decisions involving the application of dynamic
389 mobilising strategies, by exercising professional judgement to decide on and implement a plan. The
390 inability or unwillingness of fire control personnel to appropriately implement dynamic mobilising
391 strategies may prevent an effective response to an incident. Effective use of dynamic mobilising
392 strategies can provide experiential learning from their use, and through audit and review processes,

393 may be used to inform the development of response plans and pre-determined attendances, policies
394 and procedures, providing shared learning with fire control personnel, incident commanders and
395 other fire and rescue services.

396 Fire and rescue services should decide the level at which mobilising decisions including those of
397 dynamic mobilising are made and ensure appropriate policies, procedures and training for fire
398 control personnel are in place. It should ensure fire control personnel understand their role and
399 responsibilities when making mobilising decisions.

400 The inability to appropriately implement dynamic mobilising strategies may be influenced by:

- 401 • Poor communication between the fire control commander and fire control personnel
- 402 • Lack of situational awareness
- 403 • Lack of ability to make appropriate decisions
- 404 • Unfamiliarity with policies and procedures
- 405 • Decision inertia
- 406 • An organisational culture that does not genuinely empower fire control personnel to apply
407 dynamic mobilising strategies
- 408 • An organisational culture that does not encourage or seek to understand and learn from the
409 performance and outcomes of incidents

410

411 **Ineffective interpersonal communication**

412 The use of interpersonal communication skills affects the way information is received and
413 understood by others. Fire control personnel should recognise the detrimental impact of ineffective
414 or poor communication to their teams and the fire control function and apply appropriate skills to
415 avoid this occurring.

416 If fire control commanders are unable to communicate effectively with others it will impact on their
417 ability to:

- 418 • Foster trust
- 419 • Motivate others
- 420 • Gather and share information
- 421 • Issue instructions to others
- 422 • Ensure compliance with instructions
- 423 • Obtain situation reports
- 424 • Assess and provide for the needs of other agencies
- 425 • Carry out risk assessments
- 426 • Brief and debrief others

- 427 • Co-operate and co-ordinate actions with others

428

429 **Lack of personal resilience**

430 Personal resilience is the capacity of an individual to cope with stress and fatigue without it affecting
431 their performance. Both stress and fatigue may have detrimental effects on all aspects of the
432 performance of fire control personnel, from decision-making and judgement to equipment operation
433 and communication.

434 If fire control personnel are unable to manage their stress and fatigue it will impact their:

- 435 • Cognitive skills, for example:
 - 436 ○ Reduced attention span and situational awareness
 - 437 ○ Impaired memory, planning, judgement and decision-making
 - 438 ○ Inability to switch strategy
- 439 • Motor skills, for example:
 - 440 ○ Impaired hand-eye co-ordination
 - 441 ○ Impaired timing
- 442 • Communication skills, for example:
 - 443 ○ Impaired interpersonal communication skills
 - 444 ○ Impaired speech
- 445 • Social skills, for example:
 - 446 ○ Becoming increasingly distracted and irritable
 - 447 ○ Becoming less tolerant of others, affecting leadership and teamwork

448

449 **Ineffective teamwork**

450 Ineffective teamwork between fire control personnel, the fire control commander or members of
451 operational and multi-agency teams may lead to:

- 452 • A breakdown of trust between team members due to a lack of or poor communication, co-
453 operation or co-ordination
- 454 • Mistrust, resulting in conflict
- 455 • Inconsistent application of:
 - 456 ○ Service policies or procedures
 - 457 ○ Joint Emergency Services Interoperability Principles (JESIP)
- 458 • Poor quality briefings of team members about a role they are required to perform
- 459 • Poor communication and co-operation between team members

- 460 • Poor co-ordination of actions by fire control personnel
- 461 • Different levels of situational awareness within a team or between teams, resulting in
- 462 different perceptions of an incident or of fire control activity.
- 463 • Poor decision-making, including that which is counter-productive to achieving a common
- 464 goal

465 **Control measure – Leadership**

466 *CONTROL MEASURE KNOWLEDGE*

467 The [National Fire Chiefs Council \(NFCC\) Leadership Framework](#) sets out the importance of leadership
468 in the broad context of achieving a healthy, enjoyable workplace culture and managing performance
469 to improve service delivery. The framework consists of four quadrants of leadership: personal
470 impact, outstanding leadership, service delivery and organisational effectiveness. Fire and rescue
471 service leaders are expected to be capable of:

- 472 • Engaging others
- 473 • Leading across boundaries such as functions and other organisations
- 474 • Adapting to change
- 475 • Using their emotional intelligence
- 476 • Dealing with the present and anticipating future trends
- 477 • Empowering leadership at all levels
- 478 • Promoting and fostering a learning organisation
- 479 • Embracing inclusion, diversity and innovation
- 480 • Demonstrating compassion while ensuring accountability and improvement

481 The framework is based on operational and professional expertise. All fire control personnel who
482 may fulfil the role of fire control commander are leaders of the fire control function. Leadership in
483 the context of fire control is about the difference made to people affected by the performance and
484 outcomes of the decisions, actions and behaviours of a fire control commander.

485 Fire and rescue services should consider their organisational culture and its influence on the
486 command of fire control, as the leadership relationship begins prior to the receipt of an emergency
487 call. The organisational culture can influence behaviours during all states of fire control activity and
488 in all situations. This may affect the way in which fire control commanders lead their teams and the
489 way in which personnel respond. Services should also ensure relevant policies reference the factors
490 of leadership.

491 An effective fire control commander should understand the influence of the following factors on
492 their leadership:

- 493 • Self-awareness of personal limitations
- 494 • Valuing and supporting others

- 495 • Displaying and instilling confidence
- 496 • Demonstrating and fostering trust
- 497 • Fostering open, two-way communication
- 498 • The use of authority and different styles of leadership
- 499 • Setting expectations and standards
- 500 • Safety leadership
- 501 • Competence

502 Successful leadership means:

- 503 • Adopting the appropriate leadership style to suit the situation
- 504 • Having the courage and ability to make decisions with incomplete or ambiguous information
- 505 when under pressure
- 506 • Using technical knowledge and interpersonal communication skills to gather and understand
- 507 information, to develop and maintain situational awareness
- 508 • Using technical knowledge and interpersonal communication skills to develop and
- 509 implement a plan
- 510 • Forming teams of the right people with the right expertise to safely resolve an incident or
- 511 event
- 512 • Using interpersonal communication skills to establish trust between the fire control
- 513 commander and the people and teams they engage with
- 514 • Using technical knowledge and interpersonal communication skills to inspire and motivate
- 515 others
- 516 • Collaborating and co-operating effectively with others
- 517 • Valuing the contribution of others and looking after their welfare
- 518 • Demonstrating safety leadership by setting standards of performance and behaviour
- 519 • Displaying confidence and using personal resilience skills to effectively manage stress and
- 520 fatigue
- 521 • Being responsible and accountable for decisions taken and plans implemented when in
- 522 command
- 523 • Not being afraid to make or highlight mistakes and using them to learn and improve

524

525

526 *STRATEGIC ACTIONS*

527 Fire and rescue services should:

- 528 • Establish the fire control command competencies, training, validation and revalidation
529 required for leadership
- 530 • Ensure their organisational culture supports leadership relationships

531 *TACTICAL ACTIONS*

532 Fire control commanders should:

- 533 • Understand the factors that influence their leadership
- 534 • Use their leadership knowledge, skills and behaviours to instil confidence, foster trust and
535 manage safety
- 536 • Understand how valuing and supporting others, and having open and two-way
537 communication will contribute to their leadership
- 538 • Understand how the influence of using their authority appropriately will contribute to their
539 leadership
- 540 • Understand the factors that influence their leadership
- 541 • Apply the most suitable leadership styles to resolve incidents

542

543 **Control measure – Situational awareness**

544 *CONTROL MEASURE KNOWLEDGE*

545 Situational awareness represents the perception and understanding a fire control commander has of
546 the activity of the fire control function. This includes all ongoing incidents, subsequent emergency
547 calls and the impacts of supporting workloads that result from these and other activities. It also
548 consists of how the fire control commander anticipates a situation will develop taking into account
549 their actions. Good situational awareness is fundamental to being able to make effective decisions. It
550 is important for fire control commanders to ensure when handing over command that the level of
551 situational awareness is maintained.

552 The three stages of situational awareness are:

- 553 • Information gathering
- 554 • Understanding information
- 555 • Anticipation

556 In accordance with the three stages of situational awareness, fire control commanders should:

- 557 • Know the typical sources of information available to them; this will assist them to obtain and
558 maintain situational awareness

- 559 • Be able to interpret the information they have gathered, together with their knowledge and
560 past experience, into a coherent picture to understand the situation; this process will
561 continue throughout all aspects of fire control activity
- 562 • Be able to anticipate how fire control activity will develop and change based on their
563 understanding and past experience; in particular, they should be able to predict the impact
564 of their actions on fire control, incidents and subsequent activity

565 Fire control commanders need to be aware of the factors that can assist them to obtain and
566 maintain effective situational awareness. They should understand how to put in place the means to
567 monitor the fire control environment to detect changes and maintain an accurate understanding of
568 the situation. This may include the use of:

- 569 • An appropriate command structure
- 570 • Effective communication
- 571 • Command support resources
- 572 • Operational assurance
- 573 • Active monitoring arrangements

574 Effective situational awareness ensures that the interpretation reflects the actual situation. Fire
575 control commanders should be aware of the factors likely to adversely affect their situational
576 awareness. These may include:

- 577 • Stress
- 578 • Fatigue
- 579 • Biases that affect decision-making, memory recall and interactions with others
- 580 • Poor communication, for example unstructured briefs and debriefs
- 581 • Excessive spans of control
- 582 • Distractions during critical tasks
- 583 • Assumptions that are not confirmed as accurate
- 584 • Poor information management, for example, a failure to record or validate information

585

586 **Information gathering**

587 To accurately perceive a situation a fire control commander should gather and understand
588 information to enable them to anticipate how a situation may develop and what impact the actions
589 taken by fire control personnel may have.

590 The gathering, assessment and provision of risk-critical information by fire control personnel is
591 essential to ensure the safe resolution of incidents. Command decision-making can be significantly
592 affected if there is a lack of risk information or where information has not been passed on. The fire
593 control commander should establish effective communications and awareness of roles within their

594 team in order to ensure that information received from an incident ground, other control rooms,
595 members of the public and other agencies is appropriately shared and recorded on incident logs in a
596 timely manner.

597 One of the tasks of the fire control commander is to apply suitable control measures. To be able to
598 do this they must be able to gather all available information about an incident or event. This is likely
599 to include information from the pre-planning stage, such as risk information.

600 Fire control personnel will gather information from a variety of sources to gain accurate situational
601 awareness. Fire control is the primary source of information for responding personnel and
602 information gathering begins prior to the arrival of crews at an incident. Fire and rescue services
603 should ensure that fire control personnel have access to all the available and necessary information,
604 such as risk information, to assist this process.

605 The following sources of information should help to inform situational awareness throughout all fire
606 control activity:

- 607 • Incident Logs
- 608 • Resource availability systems
- 609 • Calls from members of the public
- 610 • Personnel:
 - 611 ○ Fire control personnel
 - 612 ○ Operational personnel
 - 613 ○ Subject matter experts
- 614 • Other Category 1 and Category 2 responders and control rooms
- 615 • Other agencies
- 616 • Safety information
- 617 • Operational intelligence
- 618 • Site-Specific Risk Information (SSRI)
- 619 • Site information such as:
 - 620 ○ Layout plans
 - 621 ○ Evacuation strategies
 - 622 ○ Emergency plans
- 623 • Environmental forecasting tools such as:
 - 624 ○ UK Met Office weather forecasting
 - 625 ○ UK Met Office Fire Severity Index
 - 626 ○ Environment Agency flood information and river/sea levels
 - 627 ○ Scottish Environment Protection Agency information

- 628 ○ NIDirect flood maps
- 629 ● Information and briefings provided by Local Resilience Forums
- 630 ● Audio and visual equipment, including:
 - 631 ○ Closed-circuit television (CCTV)
 - 632 ○ Aerial resources such as helicopters, satellites and drones (classified as a type of
 - 633 unmanned aircraft system by the Civil Aviation Authority)
 - 634 ○ Technologies allowing the streaming of video footage from callers, other responders
 - 635 and FRS personnel
 - 636 ○ Call Recordings

637

638 Social media may provide a useful source of information, however the reliability of the information
639 should be questioned and checked for accuracy.

640 Visual equipment such as CCTV and aerial resources is only of benefit if the downlink is available and
641 accessible for fire control personnel to view when gathering information about the incident.

642 The type of information that may be obtained includes:

- 643 ● Previous incident history at the location
- 644 ● The development of the incident
- 645 ● Numbers and locations of people missing or unaccounted for

646 Sources of information may need to be referred to at any time during all fire control activities to
647 ensure the information is still relevant and up to date. The accuracy of all information should be
648 assessed and confirmed where possible, prior to using it for decision-making. Incident logs should be
649 used to record the information gathered.

650 There may be barriers to information gathering, including:

- 651 ● The reliability of information received from callers
- 652 ● Failure of technology, such as telecommunications
- 653 ● Lack of availability of resources, such as audio or visual systems

654 Contingency arrangements should be considered and put in place for the failure of technology or the
655 lack of availability of resources.

656 Other barriers to information gathering may be due to the inability to communicate effectively with
657 callers. This includes those who may:

- 658 ● Be affected by the incident and showing signs of distress or confusion
- 659 ● Have disabilities that impair communication
- 660 ● Not have English as their first language

661

662 **Situational awareness responsibilities for all personnel**

663 As fire control personnel carry out their tasks, they may gain new information about hazards or risks.
664 Each person has a responsibility to record this information on incident logs, to inform the fire control
665 commander, and to ensure it is relayed to operational incident commanders as appropriate. This
666 new information may affect incident plans and the safety of people, property or the environment.
667 Therefore, it is important that fire control personnel are aware of their responsibilities for identifying
668 hazards and assessing risk, to support accurate situational awareness.

669 Fire control personnel should be aware of the additional facilities available to them when handling
670 emergency calls, such as interpreting services or geographical location tools. Fire control personnel
671 should also be able to identify when additional call handling support is needed and how to alert the
672 fire control commander, another supervisory manager or competent team member.

673 **Remote situational awareness**

674 Fire control commanders are remote from the incident and should therefore consider the reliability
675 of elements contributing to their situational awareness. They should question any assumptions they
676 have and constantly review the accuracy of their situational awareness, taking into consideration
677 factors such as messages received from the incident ground, information received from other
678 category 1 and category 2 responders and the consistency and reliability of information being
679 received from callers.

680 **Intra-operability**

681 There may be situations where other fire controls receive emergency calls for another fire and
682 rescue service, for example during spate conditions resulting from extreme weather conditions or a
683 major incident. Fire control commanders should be aware of the methods for managing these
684 situations and for communicating situational awareness and critical information with fire controls
685 that may be receiving such calls.

686 **Interoperability**

687 Control rooms play a vital role in managing the early stages of a multi-agency incident. Swift and
688 concise communication with other Category 1 control personnel is essential for the sharing of
689 situational awareness. It is therefore important that a dialogue between control room supervisors is
690 established as soon as possible. Fire and rescue services should ensure that methods for the joint
691 sharing of situational awareness are established and that fire control personnel are aware of JESIP
692 Control Room Supporting Principles. Fire and rescue services should also consider the provision of
693 joint training activities with Police, Ambulance and Maritime and Coastguard Agency control
694 personnel. This guidance should be read in conjunction with the JESIP Joint Doctrine – Edition Two
695 and the JESIP Control Room Supporting Principles.

696

697 *STRATEGIC ACTIONS*

698 Fire and rescue services should:

- 699 • Establish the fire control command competencies, training, validation and revalidation
700 required for situational awareness
- 701 • Establish methods for the sharing of situational awareness between fire control personnel
702 and other Category 1 responder control rooms
- 703 • Ensure fire control personnel have access to sources of information that can inform
704 situational awareness
- 705 • Ensure fire control personnel have access to resources that can assist them to manage
706 information in support of situational awareness
- 707 • Establish appropriate contingency arrangements for the failure of technology or the lack of
708 availability of resources that support situational awareness
- 709 • Ensure fire control personnel have access to methods of communicating with callers who
710 cannot understand questions or instructions, or provide information in support of situational
711 awareness
- 712 • Consider how technology may assist fire control personnel to obtain and maintain their
713 situational awareness
- 714 • Consider providing joint training activities for fire control personnel and other Category 1
715 responder control personnel

716 *TACTICAL ACTIONS*

717 Fire control commanders should:

- 718 • Ensure that appropriate methods are used to share situational awareness with other
719 Category 1 responder control rooms
- 720 • Ensure that appropriate methods are used to share situational awareness with other fire
721 control rooms
- 722 • Confirm any assumptions made are accurate to support situational awareness
- 723 • Organise fire control resources to minimise distractions and assist with information
724 management in support of situational awareness
- 725 • Use situational awareness to evaluate the potential consequences of a range of actions
- 726 • Maintain situational awareness and identify changes through active monitoring
- 727 • Regularly brief and debrief others in a structured manner to support situational awareness
- 728 • Ensure situational awareness is maintained when transferring command
- 729 • Consider using alternative methods to overcome communication barriers when gathering
730 information in support of situational awareness

731 All fire control personnel should:

- 732 • Gather information from available sources to gain accurate situational awareness; this may
733 require having appropriate and accessible equipment or technology in place
- 734 • Use appropriate methods to share situational awareness with other Category 1 responder
735 control rooms
- 736 • Validate and record information appropriately in support of situational awareness
- 737 • Provide all relevant information on a timely basis to the fire control commander to support
738 accurate situational awareness

739

740 **Control measure – Decision-making**

741 *CONTROL MEASURE KNOWLEDGE*

742 Fire control commanders need to have the ability to make sound decisions based on the elements
743 that make up an individual incident, as well as having an accurate overall interpretation of the
744 activity within the control room.

745 Decision-making is essential to the development and implementation of plans in fire control. The
746 environment within fire control is at times fast-moving with competing demands and will be subject
747 to multiple incidents and situations all requiring simultaneous decision-making processes. Plans are
748 formed out of a number of decisions beyond deciding what will be done, including how it will be
749 done, in what order and who will do it.

750 Decision-making is a fundamental command skill which can have far-reaching consequences. The
751 ability to make sound decisions, based on the characteristics of an event or situation which can be
752 dynamic and time-pressured, requires an accurate, overall interpretation of the situation. Sound
753 decisions lead to assertive, effective and safe command of the fire control function. Sound decision-
754 making will support positive outcomes in all aspects of fire control command, for example:

- 755 • Health and safety
- 756 • Fire control management
- 757 • Incident management
- 758 • Confidence and trust in their leadership
- 759 • Situational awareness
- 760 • Interpersonal relationships
- 761 • Teamwork
- 762 • Interoperability: co-operation, co-ordination and communication
- 763 • Confidence
- 764 • Personal resilience

765 Decision-making, like any complex skill, needs practice and understanding. Fire and rescue services
766 should ensure they prepare fire control commanders and fire control personnel by providing ample
767 opportunity for them to practice and develop this critical skill. The inclusion of fire control
768 commanders and their teams in fire service exercises will support this learning and development
769 through practical application.

770 Fire control commanders make decisions in relation to a wide variety of issues throughout all aspects
771 of fire control activity. These include:

- 772 • Identifying problems
- 773 • Assessing risks
- 774 • Identifying and prioritising objectives
- 775 • Deciding tactical priorities
- 776 • Developing and communicating a plan
- 777 • Active monitoring

778 It is important to acknowledge that decision-making processes and traps apply to all decision
779 makers. Decision-making happens in fire control, at the incident ground, and by other agencies. It is
780 critical that all decision makers are aware of this and the impact that each can have on the other.

781 **Decision-making strategies**

782 There are a number of decision-making processes that fire control commanders may use to reach
783 decisions. They can be broadly grouped into two main strategies:

- 784 • Intuitive decision-making, which may include conditioned processes and recognition primed
785 decision-making
- 786 • Analytical decision-making, which may include rule selection, option comparison and
787 creating new solutions

788 The difference between the two main types is the time and effort it takes to make a decision.
789 Intuitive decision-making is fast and invoked without consciously thinking. It may be driven by cues
790 and clues that can automatically and directly trigger a decision or response. Analytical decision-
791 making is consciously done and takes time and effort to do, as it involves developing and comparing
792 a number of options based on knowledge, understanding and past experience of the situation.

793

794 **Decision traps**

795 Decisions made by fire control commanders may be subjected to a number of decision traps. A
796 decision trap can be described as an errant thought process that can lead to an incorrect decision
797 being made; this may result in a situation worsening. The intuitive decision-making process is subject
798 to biases; this process can be affected by stress that can impair a number of thought processes.

799 Uncertainty can be a stressor for fire control commanders of which there are two main types:

800 • Intra-incident uncertainty: uncontrollable characteristics of an incident or situation; sources
801 of uncertainty can include:

802 ○ Too much information

803 ○ Insufficient information

804 • Extra-incident uncertainty: characteristics of the command system beyond the incident or
805 situation and outside of the control of the fire control commander; sources of uncertainty
806 can include:

807 ○ Insufficient depth of understanding about the roles of others

808 ○ Limited provision of information about inter-agency arrangements

809 Decision inertia is one type of decision trap and uncertainty has been linked to this redundant
810 deliberation to decide to take action or not because of anticipated negative consequences.

811 There are a number of other types of decision traps that may make decisions in fire control less
812 effective, including when:

813 • A decision does not fit with the objectives, tactical priorities or incident plan

814 • A decision is made on the basis of part of the situation, such as a cue or a goal, while not
815 taking account of the overall picture

816 • A decision is based on the wrong interpretation

817 • There is decision aversion

818 • There has been a failure to actively monitor and review the situation

819

820 **Decision control process**

821 Fire control personnel are responsible for the decisions they make. They should be able to provide
822 reasoned justifications for what they did and why. This is supported by the use of the decision
823 control process (DCP). The process also assists in mitigating against the likelihood of falling into a
824 decision trap.

825 The DCP is scalable. It can be applied to basic decisions made for a task or problem. It can also scale
826 up for use in planning the response and support to multiple incidents. It complements the [Joint
827 Emergency Services Interoperability Principles \(JESIP\) Joint Decision Model](#) for multi-agency decision-
828 making, particularly for assessing risk and developing a working strategy.

829 Evidence shows that decisions are not always made in a linear way, as represented in other decision-
830 making models. The DCP recognises this to support practical decision-making within the fire control
831 environment.

832 Under some circumstances, decision makers will respond rapidly and directly to an element of the
833 situation, moving from situation assessment to action. This may happen when a cue prompts an
834 intuitive decision. The DCP takes account of the way people naturally make rapid decisions. It
835 presents some safeguards against potential decision traps. It also accounts for the slower and more
836 reflective analytical type decision processes where plans are explicitly formulated.

837 The way an individual will make a decision may not be consciously selected. It depends on a number
838 of factors related to the situation, perceived and actual time pressures, and the command role
839 adopted. For example, a senior commander planning the resolution of a large-scale incident may be
840 more likely to reach a decision using an analytical process. Time constraints and the type of calls
841 being received will impact the way fire control personnel may reach decisions. For example, initial
842 mobilising decisions need to be made rapidly and often with limited information, however when
843 deciding on the actions to be taken to fulfil relief crew requirements or operational cover moves,
844 more time can be taken to reach decisions and to put appropriate plans in place.

845 The process consists of four stages that are actively monitored. These are:

- 846 • Situation; incident intelligence
- 847 • Plan; based on situational awareness
- 848 • Decision controls; rapid mental check that decision is appropriate and safe
- 849 • Action; implementation of plan

850

851 Figure: Decision control process

852 Fire control commanders should actively monitor and evaluate the situation and ensure their plan
853 remains suitable and is making progress in accordance with expectations.

854 **Situation**

855 All commanders base their decisions on the way they interpret a situation. Good situational
856 awareness is key to understanding the situation in a coherent way and helps to predict likely
857 developments. By assessing the situation, the fire control commander can understand the current
858 characteristics and details of an incident, event or situation and consider the desired end state.

859 Fire control commanders should continually assess the situation to support an accurate awareness,
860 reviewing their plan and the information used to formulate it. They should gather relevant
861 information while making the best use of the time available, including:

862 • Incident information:

863 ○ The current situation

864 ○ What led to the current situation

865 ○ How the situation might develop

866 • Resource information:

867 ○ The available resources

868 ○ The resources required to deal with the current situation

869 ○ What resources will be required, based on the expectations of how the situation will
870 develop

871 • Risk information

872 ○ The hazards

873 ○ Who is at risk

874 ○ What is at risk

875 ○ What control measures can be used

876 ○ What the potential benefits of a course of action are

877 Fire control commanders should identify the fire control resources currently available to them and
878 those likely to be required to deliver the fire control function safely and effectively. Appropriate
879 methods to increase the capacity of the control room should be considered, implemented and
880 managed in a timely way. The time it will take for additional fire control personnel to arrive, or for
881 the implementation of alternative call handling arrangements should be considered when
882 developing plans, and available resources should be managed effectively at all times.

883 There are technological resources that can directly support situational awareness and assist with
884 decision-making, including specialist software such as those available via weather forecasting
885 services, environmental and government agencies.

886 For specific incident types, events or situations, early identification of the need and requests for
887 specialist advice or assistance may be advantageous.

888 **Plan**

889 After assessing the situation, the fire control commander should consider the plans needed. They
890 should understand the current situation and the factors that are affecting fire control activity. From
891 this they can identify their objectives and develop a plan.

892 Their plans may include:

- 893 • The objectives and goals for the incident, event or situation
- 894 • The priorities of the fire control function
- 895 • The call handling resources available
- 896 • The levels of skills and experience of fire control personnel
- 897 • Welfare arrangements for fire control personnel
- 898 • Information received from operational incidents
- 899 • How personnel are going to achieve the priorities
- 900 • Whether specialist assistance will be required
- 901 • What equipment or additional processes will be required
- 902 • The expected outcome and timings
- 903 • Contingency arrangements

904 Plans should be regularly reviewed and updated based on active monitoring of how effectively
905 objectives are being met. Active monitoring should be used to evaluate the situation to ensure plans
906 remain suitable and are making progress in accordance with expectations.

907 Plans should be adapted in accordance with changes if there are unexpected developments in the
908 incident, event or situation, or in the overall fire control activity.

909 Planning and review should be done in conjunction with the incident commander and command
910 support officers to ensure that it is understood whether incident ground requirements are being
911 met.

912 **Decision controls**

913 Decision controls represent a safety mechanism to guard against decision traps within the decision
914 control process. They build in reflective thinking ahead of decisions being made and support fire
915 control commanders in ensuring they understand:

- 916 • Why they want to make the decision
 - 917 ○ The goals it links to
 - 918 ○ The rationale

- 919 • What they expect to happen
 - 920 ○ Anticipate the likely outcome of the action, in particular the impact on the objective
921 and other activities
 - 922 ○ How the incident, event or situation will change as a result of the action
923 ○ What cues are expected
- 924 • Whether the benefits are proportional to the risks
 - 925 ○ Consider whether the benefits of proposed actions justify the risks that would be
926 accepted

927 **Action**

928 This involves implementing the decisions that have been made. Wherever feasible, decision controls
929 should be applied before this phase, or as soon as possible afterwards. This applies whether decision
930 makers move to Action from Plan, or directly from Situation assessment. The two elements of this
931 phase are:

- 932 • Communicate the outcomes of the decision effectively, by issuing instructions and sharing
933 information; this may also involve providing updates on the situation, on progress, or other
934 information about what is happening at an incident
- 935 • Control how the activities are implemented to achieve the desired outcomes; This may
936 require delegating responsibility where this will help increase or maintain control

937 **Active monitoring**

938 Fire control personnel should actively monitor and evaluate the situation, including progress being
939 achieved, to ensure their situational awareness remains accurate. The fire control commander
940 should ensure this takes place and that situational awareness is shared.

941 Fire control commanders should consider whether their plans are suitable, sufficient and safe; they
942 should consider and question any areas of uncertainty, especially where they have made
943 assumptions. An active monitoring process by fire control commanders and their teams is essential
944 to aid situational awareness during ongoing incidents.

945 Progress information should be considered, including:

- 946 • Actual progress: what progress has actually been made
947 • Expected progress; how does this compare to the expected progress948 • Predicted progress; what further progress is predicted949 • Comparison of what happened to what was envisaged to happen; what is now predicted

950 Operational assurance arrangements can help maintain accurate situational awareness. Due to the
951 limitations of available personnel in fire control, operational assurance activities may not be feasible
952 during incidents, however they should be considered during incident management where possible.

953 Operational audits in fire control may provide a source of information for learning both within the

954 fire control function and in the wider fire and rescue service, however, in order to be effective they
955 should be carried out by personnel who are appropriately trained to assess and monitor the
956 performance of others.

957 For further information refer to Corporate guidance for operational activity: Operational audits.

958

959 **Dynamic Mobilising**

960 Dynamic mobilising is a concept that deals specifically with the use of professional judgement by fire
961 control personnel when deciding on the level of response that is mobilised to an incident based on
962 the information being received. It is defined as ‘the ability to achieve the best match between
963 incident need and resources available at the earliest opportunity to ensure those in need receive a
964 safe and appropriate service’.

965 Fire and rescue services should be aware that dynamic mobilising is terminology that may also be
966 adopted by some suppliers of mobilising systems to describe technologies that use automatic vehicle
967 location systems to identify and propose a resource for mobilisation. This is distinct from the use of
968 the term in this guidance. Dynamic mobilising in this context refers to the professional judgment
969 and human intervention made by fire control personnel based on intelligence being received from
970 emergency callers and other agencies.

971 Fire and rescue services will decide in advance on the appropriate level of response for each incident
972 type that it can foreseeably anticipate attending. The level of response will be decided based on a
973 task analysis or similar methodology that assesses the number and type of resources that it needs
974 for the safe resolution of incidents. This information provides the initial predetermined attendance
975 that is used within the mobilising system. It is therefore essential that fire control personnel
976 understand this process and select the most appropriate incident type based on the type of call and
977 the information gathered. This will form the basis of their risk assessment when deciding on the
978 level of response to be mobilised.

979 Dynamic mobilising enables fire control personnel to utilise all available information at the point of
980 call to decide upon the most appropriate response according to the risk. As more information is
981 obtained from callers and other responding agencies the fire control commander should assess the
982 situation and may alter or amend the level of response or pre-determined attendance and initial
983 mobilising decisions. Accurate situational awareness and continuous assessment is essential to
984 ensure the most appropriate response.

985 Most situations that fire control personnel are faced with are not unique and are foreseeable. In
986 managing incidents, fire control commanders use their own experience and knowledge of guidance,
987 pre-determined attendances, response plans and action plans, together with that of fire control
988 personnel and the operational command team. Fire and rescue services should ensure that fire
989 control personnel are sufficiently aware of policies and procedures, and the capability of the
990 available resources.

991 In all situations where dynamic mobilising strategies are used it is essential that the rationale for the
992 decision and any subsequent decisions and actions is recorded on the incident log and the fire

993 control commander informed at the earliest opportunity.

994 Fire control personnel may also consider reallocating resources already en route to an incident when
995 the new incident type is of a higher priority. In this situation it is essential that the fire control
996 commander is informed, that the resource is replaced, and the incident log is completed with the
997 decision-making rationale.

998 When overseeing the implementation of dynamic mobilising strategies, the fire control commander
999 should consider:

- 1000 • Level of skills and experience of fire control personnel tasked with the mobilisation of
1001 resources
- 1002 • Supervision needs of fire control personnel
- 1003 • Location of available resources
- 1004 • Travel time of resources to the incident
- 1005 • Access to the incident
- 1006 • Any additional or conflicting information received from emergency callers
- 1007 • The availability and location of specialist equipment
- 1008 • The need for specialist skills and expertise
- 1009 • Tactical and other specialist advisers
- 1010 • Police, Ambulance and other Category 1 and Category 2 responders

1011 **Operational discretion**

1012 Operational discretion relates to unusual circumstances where strictly following an operational
1013 procedure would be a barrier to resolving an incident, or where there is no procedure that
1014 adequately deals with the incident. When incidents occur for which no policy exists and that require
1015 fire control personnel to make innovative or unorthodox decisions, it is essential that the decision-
1016 making rationale is recorded and all appropriate actions are taken.

1017 These actions should include:

- 1018 • The informing of the fire control manager
- 1019 • The informing of the incident commander
- 1020 • The informing of other officers responsible for operational events such as duty officers
- 1021 • Recording of the decision-making rationale
- 1022 • Recording of all resulting actions

1023 Fire and rescue services should foster an organisational and operational culture that encourages and
1024 empowers the appropriate use of dynamic mobilising strategies and operational discretion in fire
1025 control. The aim should be to instil confidence in fire control commanders to share their
1026 experiences, and to value the lessons learned. Services should ensure that all personnel understand
1027 why it may be appropriate for dynamic mobilising strategies and operational discretion to be applied
1028 by fire control personnel.

1029 Fire and rescue services should develop their fire control personnel by testing their personal
1030 resilience and decision-making under pressure; appropriately using both of these command skills is
1031 essential when applying dynamic mobilising strategies and operational discretion.

1032 The application of dynamic mobilising strategies and operational discretion may assist with local,
1033 regional or national learning; for further information refer to [National Operational Learning: Good](#)
1034 [practice guide for fire and rescue services](#). Fire control commanders should be prepared to
1035 participate in reviews of policies and procedures following the application of operational discretion.
1036

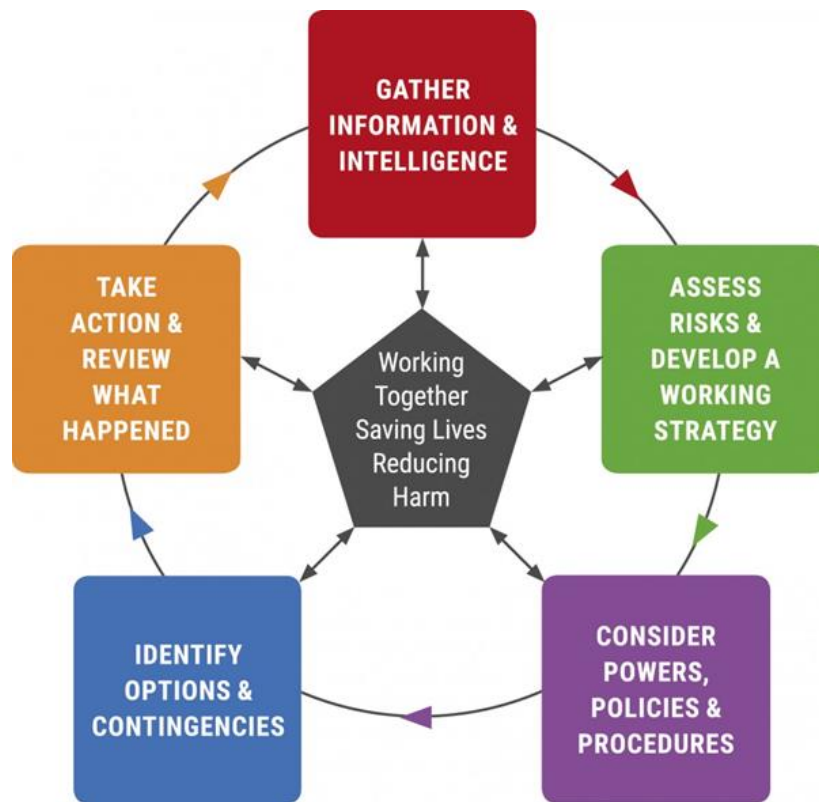

1037

1038 **Joint decision-making**

1039 Decision-making during incidents may also be carried out by other responders. At multi-agency
1040 incidents the [Joint Emergency Services Interoperability Principles \(JESIP\) Joint Decision Model](#) is the
1041 process that emergency responders have agreed to use for joint decision-making.

1042 In addition to the fire and rescue service decision control process, the joint decision model aims to
1043 determine:

- 1044 • If there is a common understanding and position on the situation and response held by the
1045 multi-agency team of commanders
- 1046 • If the collective decision is fit for purpose for each of the commanders

1047

1048 Figure: JESIP joint decision model

1049 The decision control process supports the JESIP joint decision model. Commanders use the decision
1050 control process to develop their incident plan, which will then be shared with other agencies when
1051 applying the joint decision model. Agencies will jointly agree the multi-agency objectives, with each
1052 having an understanding of their role in achieving these.

1053 These multi-agency objectives will need to be translated into actions and incorporated in each
1054 service's incident response plan. Fire incident commanders will consider these collective objectives,
1055 and consider the tactical priorities and operational tactics required, integrating them into their
1056 incident plan using the decision control process.

1057 The JESIP Control Room Supporting Principles provide the framework for the sharing of situational

1058 awareness between control rooms, and the mechanism for the setting up of multi-agency
1059 interoperable voice communications. Once established, multi-agency talk-groups or other methods
1060 such as conference calls will allow responding commanders and control rooms to share situational
1061 awareness and the decisions made.

1062 **Decision logs**

1063 It is essential that fire and rescue services consider the methods of recording the decisions made in
1064 fire control.

1065 It is the role of fire control personnel to record all actions carried out and decisions taken in fire
1066 control in connection with the incidents managed. The electronic incident log generated by the
1067 mobilising system provides an adequate method for recording actions and decisions, however fire
1068 and rescue services may also consider the use of separate decision logs in some circumstances, for
1069 example during business continuity events.

1070 Electronic incident logs generated by mobilising systems should be maintained and updated,
1071 recording key events and actions in addition to the recording of all messages and routine incident
1072 activity. The electronic incident log provides a method of accurately maintaining a time-stamped
1073 record of the actions taken by fire control personnel, however this should be considered when
1074 recording decisions and decision-making rationale. The time the decision was actually taken, and by
1075 whom, should also be recorded.

1076 Fire and rescue services may consider the configuration of the incident narrative log to provide
1077 methods for inputting information that identifies the type of message. This will aid information
1078 management during an incident and provide a clear record to review in the post-incident phase.

1079 The incident log should record all decisions made which influence an incident, even if there is
1080 uncertainty over how important a decision might turn out to be. It is important to record the
1081 rationale behind each decision and the context in which it was made as it can be very difficult to
1082 recall this context once time has passed. This will help those who may examine the decision-making
1083 process in the future.

1084 The entries to the incident log must include:

- 1085 • The time that the decision was taken
- 1086 • A description of the decision and the rationale behind it
- 1087 • A description of other options that were available and why these were discounted
- 1088 • The name of the person or people making the decision – if it was a shared decision the
1089 names of all involved in the decision-making should be included
- 1090 • Resulting actions including who the decision was shared with or communicated to

1091 The incident log provides:

- 1092 • An accurate, 'at the time', record of decisions made, including those where no action is
1093 taken
- 1094 • An audit trail of decisions, along with the reasons for making them based on the information
1095 available at the time

- 1096 • A record of new information or changes in the situation
 - 1097 • A record of the actions taken relating to the incident
 - 1098 • A record of risk-critical information from other services or agencies
 - 1099 • A way of helping the handover between fire control personnel
- 1100 To support the recording of decision-making rationale during larger or more complex incidents, fire
 1101 and rescue services may consider providing fire control officers in charge with access to
 1102 technological solutions such as body worn cameras or voice recorders. Fire and rescue services may
 1103 also consider using voice recording methods included within fire control mobilising systems to allow
 1104 fire control personnel to capture their decision-making rationale. Information from such devices
 1105 may then be retained and accessed in line with the fire and rescue service’s own data retention and
 1106 information management policies. Fire and rescue services may also consider providing fire control
 1107 personnel with additional loggist training to support them in identifying and appropriately recording
 1108 the decisions made.
- 1109 The information recorded within incident and decision logs and voice recording systems provides
 1110 post-incident debriefs with a decision-making audit trail to review, enabling lessons to be learned
 1111 from an incident and providing effective feedback to aid operational improvement.
- 1112 There may be occasions where fire control commanders or fire control personnel are called upon to
 1113 provide evidence at formal inquiries or legal proceedings. This may be as a result of their
 1114 involvement during a major incident or because of the nature of an emergency call and the
 1115 circumstances of the situation. It is therefore vital that all material relating to an incident, including
 1116 audio recordings, handwritten notes and records of debriefs, are retained in accordance with the fire
 1117 and rescue service’s data retention policies.
- 1118 All incident and decision logs and audio recordings, including material relating to other incidents
 1119 ongoing at the time, will be admissible as evidence in any subsequent criminal, inquisitorial or
 1120 coronial process that follows. Care should therefore be taken to ensure that appropriate language is
 1121 used and that accounts are written in such a way that they will be understood at a later date.
- 1122 Further information regarding attendance at coroners court, public inquiry or the equivalent can be
 1123 found in:
- 1124 • Corporate guidance for operational activity – Legal proceedings.
 - 1125 • Fires and Firefighting – Attendance at coroners court (or equivalent)

1126 *STRATEGIC ACTIONS*

1127 Fire and rescue services should:

- 1128 • Establish fire control command competencies, training, validation and revalidation required
 1129 for decision-making, including the application of dynamic mobilising strategies and
 1130 operational discretion
- 1131 • Establish appropriate methods for carrying out operational assurance activities in fire control

- 1132 • Ensure that policies, procedures and training for fire control personnel consider the Joint
1133 Emergency Services Interoperability Principles (JESIP) Joint Decision Model
- 1134 • Ensure that policies and procedures are sufficiently flexible to support the application of
1135 dynamic mobilising strategies in fire control
- 1136 • Review operational policies and procedures and share any lessons learned post-incident and
1137 following the application of dynamic mobilising strategies and operational discretion
- 1138 • Have appropriate systems in place that enable fire control commanders to record the
1139 reasons and rationale that support their decision-making
- 1140 • Consider the provision of technological solutions to support the recording of decisions made
1141 and their rationale

1142 *TACTICAL ACTIONS*

1143 Fire control commanders should:

- 1144 • Make decisions that support the responsibilities of the fire and rescue service including the
1145 safety of personnel, other responders and the public
- 1146 • Select appropriate actions by applying the decision controls to avoid decision traps
- 1147 • Develop and communicate plans for the delivery of the fire control function to relevant
1148 personnel
- 1149 • Regularly review, update and communicate changes to plans
- 1150 • Use appropriate technology to support their decision-making
- 1151 • Identify the fire control resources currently available to take immediate action, and request
1152 those likely to be needed to fulfil the activities of fire control
- 1153 • Use incident or decision logs to contemporaneously record the rationale for the decisions
1154 made during all incidents
- 1155 • Consider applying dynamic mobilising strategies to achieve the best match between incident
1156 need and resources available
- 1157 • When applying dynamic mobilising strategies , ensure all personnel know what actions are
1158 being taken and why
- 1159 • Participate in reviews of operational policies and procedures following the application of
1160 dynamic mobilising strategies or operational discretion

1161 All fire control personnel should:

- 1162 • Be aware of the different types of decision-making processes, and the factors that may
1163 influence which process they are likely to adopt
- 1164 • Use appropriate methods to record their actions, decisions and decision-making rationale
- 1165 • Use incident typing to support consistent and sound decision-making when mobilising
1166 resources to incidents

- 1167 • Identify the operational resources currently available to take immediate action

1168 **Control measure – Interpersonal communication**

1169 *CONTROL MEASURE KNOWLEDGE*

1170 Good interpersonal communication skills are essential for effective fire control command;
1171 communication is the tool used by commanders to facilitate many aspects of their role.
1172 Interpersonal communication skills are used to transfer information between fire control
1173 commanders and other people. Effective use of these skills will ensure that what is said and
1174 emphasised is supported by the way it is said and the body language of the speaker.

1175 Communication can be a direct one-way process such as an order, which may need to convey a
1176 sense of urgency. Communication can be a simple two-way process that involves an exchange of
1177 information; effective interpersonal communication skills can be used to ensure that the information
1178 received has also been understood, by using active listening and confirmatory questions.

1179 Effective communication between fire control commanders and others is of primary importance in
1180 fire control. The quality of communication moderates the degree to which people communicate, co-
1181 operate and co-ordinate with each other.

1182 Effective interpersonal communicators should:

- 1183 • Actively listen to others
- 1184 • Communicate with clarity and confidence
- 1185 • Adopt the most appropriate communication style for the situation
- 1186 • Verify information communicated to them to avoid making assumptions
- 1187 • Avoid barriers to effective communication
- 1188 • Ensure their verbal and non-verbal communication aligns
- 1189 • Check for confirmation of understanding

1190 Fire and rescue services should be aware that the culture of their organisation can influence
1191 behaviours. This may affect the way in which fire control officers in charge communicate with others
1192 and the way in which personnel respond.

1193 The manner in which a fire control commander communicates may affect the perception of them in
1194 terms of their competence, confidence and trustworthiness. This perception can influence the
1195 actions and behaviours of others, which may impact on several important aspects of command,
1196 including:

- 1197 • How information is managed
- 1198 • How information is received by others
- 1199 • The quality and frequency of information that is shared with incident commanders and
1200 responding agencies

- 1201 • The transfer of command
- 1202 • The extent of personal, team and organisational learning from incident reviews
- 1203 Fire and rescue services should reference the important characteristics of effective interpersonal
- 1204 communicators in relevant policies.
- 1205 When transferring command, briefing or debriefing, fire control commanders should communicate
- 1206 clearly and concisely, following a recognised structure. This assists others to engage, follow and
- 1207 understand the information and to identify when something may have been inadvertently omitted.
- 1208 Fire control officers in charge should check the other person's understanding of important
- 1209 communications to ensure there is a shared understanding of the information.

1210 *STRATEGIC ACTIONS*

1211 Fire and rescue services should:

- 1212 • Establish the fire control command competencies, training, validation and revalidation
- 1213 required for interpersonal communication skills
- 1214 • Ensure their organisational culture supports the use of good interpersonal communication
- 1215 between all personnel

1216 *TACTICAL ACTIONS*

1217 Fire control commanders should:

- 1218 • Use interpersonal communication skills and behaviours to demonstrate their competence,
- 1219 instil confidence, and foster trust with others
- 1220 • Value and support others to establish open, two-way communication to gather and share
- 1221 information using interpersonal communication skills
- 1222 • Using interpersonal communication skills, apply the most appropriate communication style
- 1223 to suit the audience or situation
- 1224 • Use interpersonal communication skills when communicating objectives, priorities and
- 1225 tactics to be adopted to resolve an incident or situation
- 1226 • Provide regular situation updates to all responders by using interpersonal communication
- 1227 skills and protocols, such as M/ETHANE
- 1228 • Apply interpersonal communication skills and use a recognised structure when transferring
- 1229 command, briefing or debriefing

1230 **Control measure – Personal resilience**

1231 *CONTROL MEASURE KNOWLEDGE*

1232 Stress is caused by a mismatch between the demands placed on an individual and their ability to

1233 cope. Fire control officers in charge are exposed to a variety of potential sources of stress, including

1234 stressors associated with chronic and acute stress.

1235 Chronic stress may occur when there are long-term demands and pressures over which an individual
1236 believes they have no control. This can include work life or organisational factors, such as shift
1237 patterns, workload or culture. It can also include private life factors, such as relationships or
1238 bereavement.

1239 Acute stress may occur when there are short-term demands and pressures associated with recent or
1240 on-going events. This includes the decision-making, planning and communication skills expected of
1241 fire control commanders. Stressors can also result as a consequence of the working environment, for
1242 example, uncertainty, rapidly changing situations or exposure to traumatic events.

1243 Fire control commanders should understand the difference between chronic and acute stress. They
1244 should know the causes, symptoms, and effects on performance of fatigue and chronic and acute
1245 stress.

1246 Appropriate levels of acute stress benefit performance as it increases alertness, but excessive acute
1247 stress will adversely affect cognitive performance, and sustained periods can lead to fatigue. Mental
1248 and physical fatigue are associated with feelings of tiredness and weakness and may affect physical
1249 and cognitive skills.

1250 The impact of stressors on performance is not inevitable. Instead, it depends on an individual's
1251 capacity to cope with them; their personal resilience. Personal resilience consists of an individual's
1252 evaluation of potential stressors and their access to coping strategies to manage them. Personal
1253 resilience may be thought of as the capacity of an individual to cope with stress and fatigue without
1254 it affecting their performance.

1255 Fire control commanders should understand what affects their personal resilience and capacity to
1256 cope with stress and fatigue. Factors that enhance personal resilience include:

- 1257 • Experience of fire control command
- 1258 • Workload management
- 1259 • Training which ensures aspects of performance are automated
- 1260 • Perception of the predictability and controllability of stressors
- 1261 • Confidence
- 1262 • Positive outlook
- 1263 • Social support
- 1264 • Physical fitness

1265 Fire control commanders need to recognise the signs and symptoms of stress and fatigue in order to
1266 know when they are beginning to affect their performance and that of others. They need to know
1267 and understand what actions to take before stress or fatigue begins to reduce performance, in order
1268 to maintain safety. This may include:

- 1269 • Creating time to think
- 1270 • Maintaining an effective span of control

- 1271 • Resting, rehydrating and eating
 - 1272 • Recording thoughts and information for use later
 - 1273 • Actively monitoring time
 - 1274 • Consulting with others
- 1275 Fire and rescue services should ensure post-incident reviews and safety event investigations
 1276 explicitly consider the impact of stress and fatigue on fire control commanders, incident
 1277 commanders, operational and fire control personnel, and others involved.
- 1278 *STRATEGIC ACTIONS*
- 1279 Fire and rescue services should:
- 1280 • Establish the command competencies, training, validation and revalidation required for
 1281 personal resilience
 - 1282 • Ensure post-incident reviews and safety event investigations consider the impact of stress
 1283 and fatigue on fire control personnel
- 1284 *TACTICAL ACTIONS*
- 1285 Fire control commanders should:
- 1286 • Manage their working environment and workload to mitigate the effects of stress and
 1287 fatigue, and to optimise their personal resilience
 - 1288 • Recognise the symptoms of stress and fatigue in themselves and others and the negative
 1289 affect they may have on performance, by understanding the varying levels of personal
 1290 resilience
 - 1291 • Implement actions that will reduce the effects of stress and fatigue on themselves and
 1292 others before performance is affected, based on the varying levels of personal resilience
- 1293 **Control measure – Teamwork**
- 1294 *CONTROL MEASURE KNOWLEDGE*
- 1295 A team may be defined as two or more people with clearly defined roles temporarily working
 1296 together interdependently toward achieving a common goal that exceeds individual or
 1297 organisational goals.
- 1298 Fire control commanders take on the role of team leader in fire control in order to create their
 1299 command structure and team and to exercise their leadership skills. To support teamwork during
 1300 incidents fire control commanders and fire control personnel should be considered to be part of the
 1301 operational team or wider multi-agency team and should receive appropriate updates and briefings
 1302 in a timely manner.
- 1303 Fire control commanders will need to use their teamwork skills to lead fire control personnel based
 1304 on their priorities and the demands of fire control activity. These include:

1305

1306 • Communicating effectively to establish and maintain trust between themselves and other
1307 team members

1308 • Co-operating with operational incident command team members and the team members of
1309 other agencies

1310 • Co-ordinating the actions of their team and also with those of teams on the incident ground
1311 and in other agencies

1312 • Supporting others to carry out their role or task

1313 Effective teamwork is essential for the safe resolution of incidents; it is also essential when intra-
1314 operability or interoperability is in use. Fire control commanders should know and understand how
1315 different elements of team working can affect team performance. They should recognise that
1316 effective teamwork enables the consistent application of service and JESIP policies and procedures.

1317 Teamwork engages team members, gains their commitment, and can contribute to lower levels of
1318 stress. It also facilitates intra-operability between fire and rescue services, and interoperability
1319 between other emergency services and responders.

1320 Fire control commanders should understand the different responsibilities of the roles they may
1321 assign to personnel, such as radio operator or emergency call taker. To support teamwork and
1322 communication with the incident ground they should also understand operational command and
1323 specialist roles, such as tactical advisers and fire investigators

1324 Fire control commanders should be aware of the stages of team formation. The fire control
1325 commander will usually know their team members, however there may be occasions when they are
1326 required to form a team with people they are not familiar with, and so should ensure effective
1327 communication with individuals to understand their levels of experience, knowledge and skills in
1328 order to avoid their team management being compromised.

1329 Teamwork in the wider context of the relationship between fire control and incident grounds should
1330 also be considered. Working relationships and practices will be strengthened through the
1331 engagement, commitment and trust of all team members and the understanding of their roles.

1332 Fire control commanders may also be required to form part of a multi-agency team during complex
1333 or major incidents, or during spate conditions, particularly during the early stages of an incident until
1334 a senior fire control manager or operational commander can assume the role. During this phase the
1335 fire control commander may be required to form or join a team using technologies such as radio talk
1336 groups or conference call facilities. JESIP Control Room Supporting Principles describe the elements
1337 of interoperability between control rooms and fire control personnel should be familiar with the
1338 doctrine.

1339 Fire control commanders should understand the roles, responsibilities and capabilities of other
1340 emergency services and of other agencies who respond to incidents, such as local authorities. It is
1341 likely that a fire control commander will not know the other members of a multi-agency team or be
1342 familiar with their experience, knowledge and skills, however it is essential that they use effective
1343 teamwork and communication techniques to foster a positive working relationship.

1344 Fire control commanders should recognise the importance of trust between themselves and

1345 members of their team, and of the wider operational team or multi-agency team members,
1346 especially when team members are unknown to them. Under such circumstances establishing trust
1347 is paramount, for example, in each other's abilities to perform their respective roles.

1348 Fire control commanders should recognise how effective communication and co-operation benefits
1349 teamwork. They should understand the impact trust has on co-operation, co-ordination and
1350 communication and in turn the affect these may have on shared situational awareness and decision-
1351 making.

1352 All fire control personnel should be prepared to function effectively as a team member and to
1353 perform an appropriate role within the command structure.

1354 *STRATEGIC ACTIONS:*

1355 Fire and rescue services should:

- 1356 • Establish the fire control command competencies, training, validation and revalidation
1357 required for teamwork

1358 *TACTICAL ACTIONS:*

1359 Fire control commanders should:

- 1360 • Form their command structure in accordance with the priorities and demands of an incident
1361 or situation
- 1362 • Communicate effectively with members of their team, incident command teams and with
1363 multi-agency team members to engender trust
- 1364 • Support the members of their team, incident command teams or multi-agency teams in
1365 accordance with their individual or organisational needs
- 1366 • Co-operate with members of their team, incident command teams or with multi-agency
1367 team members
- 1368 • Co-ordinate the actions of their team in support of their plan
- 1369 • Co-ordinate fire control actions and tasks with those of other emergency services and
1370 agencies to support a multi-agency plan

1371

1372 **Hazard – Overwhelmed emergency call handling capacity**

1373 *HAZARD KNOWLEDGE*

1374 As part of their risk management plan each fire and rescue service should consider the fire control
1375 resources they need to mobilise to an incident to support effective incident resolution and
1376 command, and to fulfil all foreseeable activity required of the fire control function.

1377 However, there may be occasions where the call volume and subsequent workloads being
1378 experienced in fire control exceed the capacity of the personnel immediately available. This can
1379 happen when fire control personnel leave the control room for welfare breaks or planned activities
1380 such as training or personal development. It can also happen as a result of unexpected spate or spike
1381 call volume conditions.

1382 The ability of fire control commanders to effectively manage emergency calls and mobilise resources
1383 may be key to the success or failure of an incident commander’s strategy or plan to resolve
1384 incidents. Any failure or delay in the mobilisation of sufficient and appropriate personnel,
1385 equipment, specialist skills and other agencies to an incident may:

- 1386 • Delay operational intervention
- 1387 • Increase the risk to the public, including people at risk and casualties
- 1388 • Reduce the safety of personnel or other emergency responders
- 1389 • Result in loss of or damage to property
- 1390 • Have a detrimental effect on the environment
- 1391 • Affect the reputation of the fire and rescue service
- 1392 • Impact on levels of public confidence
- 1393 • Delay community recovery

1394

1395 The ability of the fire control commander to select the most appropriate method to manage the
1396 situation using the options available to them is therefore essential to ensure the resilient delivery of
1397 the fire control function.

1398

1399

1400 **Control measure – Additional call handling capacity: Fire control personnel**

1401 *CONTROL MEASURE KNOWLEDGE*

1402 As no two situations are the same it is imperative that fire control commanders are able to correctly
1403 identify the resources available to them to take immediate action and should begin assessing the
1404 need to apply measures to augment call handling capacity where possible as soon as call volumes
1405 begin to increase.

1406 Their assessment, which may give an indication of the required resources, should be based on the
1407 number and type of calls being received, the predicted duration of incidents and likelihood of
1408 incidents being protracted, together with other ongoing operational incidents and fire control
1409 activity.

1410 Fire control commanders should have a thorough knowledge of the methods of achieving increased
1411 call handling capacity and of how to select appropriate methods.

1412 The methods of achieving increased call handling capacity may include:

- 1413 • Recall of on duty fire control personnel from welfare breaks
- 1414 • Recall of on duty fire control personnel from training or other activities
- 1415 • Recall of off-duty fire control personnel
- 1416 • Requesting assistance from other suitably trained and competent personnel
- 1417 • Consideration of the use of buddy emergency call handling arrangements
- 1418 • Consideration of the use of call filtering methods by Call Handling Agents (BT)
- 1419 • Consideration of the use of call redistribution methods by Call Handling Agents (BT)

1420 The fire control commander should be aware of the number and location of on duty fire control
1421 personnel and the methods for recalling them to fire control from welfare breaks or other activities.
1422 In addition, the fire control commander should be aware of the location and availability of other
1423 suitably trained and competent personnel, such as fire control personnel carrying out supporting day
1424 duties roles that do not form a part of the duty shift or watch.

1425 When assessing levels of fire control activity and related workloads it is essential that the fire control
1426 commander takes into consideration the welfare of fire control personnel and puts measures in
1427 place for sufficient rest and meal breaks to be taken, giving consideration to any interruptions to
1428 breaks as a result of increased workloads.

1429 During sustained periods of increased activity, such as during spate conditions resulting from
1430 extreme weather, or a major incident, where it can be predicted that increased fire control capacity
1431 is required beyond that immediately available, the fire control commander may consider recalling off
1432 duty fire control personnel. When selecting this option, the time that it will take for additional fire
1433 control personnel to arrive should be considered.

1434 Where advance notice is received of extreme weather or other conditions where increased
1435 emergency call volume can be predicted, the fire control commander should ensure their
1436 management teams are made aware so that emergency call handling capacity can be assessed and
1437 increased in advance if necessary.

1438 *STRATEGIC ACTIONS*

1439 Fire and rescue services should:

- 1440 • Establish the command competencies, training, validation and revalidation required for
1441 additional call handling capacity
- 1442 • Provide methods of recall of on-duty fire control personnel and other suitably trained and
1443 competent personnel
- 1444 • Consider providing methods of recall of off-duty fire control personnel and other suitably
1445 competent personnel
- 1446 • Identify personnel who are competent to carry out emergency call handling
- 1447 • Ensure methods are in place to obtain intelligence for events or situations that may increase
1448 emergency call volumes
- 1449 • Ensure methods are in place to increase call handling capacity during events or situations
1450 that may increase emergency call volumes

1451 *TACTICAL ACTIONS*

1452 Fire control commanders should:

- 1453 • Have an awareness of the options available for increasing emergency call handling capacity
- 1454 • Select the most appropriate method to recall fire control personnel and other suitably
1455 personnel
- 1456 • Consider the welfare needs of fire control personnel when planning call handling capacity

1457 **Control Measure – Additional call handling capacity: Emergency call redistribution**

1458 *CONTROL MEASURE KNOWLEDGE*

1459 Fire control commanders should be aware of the methods of emergency call redistribution and how
1460 these may affect their command and management of fire control.

1461 Fire and rescue services should ensure contingency arrangements are made for the redistribution of
1462 emergency calls during periods of increased demand such as spate or spike conditions or a major
1463 incident. These arrangements may include a buddy arrangement with another emergency service for
1464 the handling of emergency calls.

1465 The term ‘buddy’ is defined as ‘a pre-nominated fire control room to be used by the call handling
1466 agent for the distribution of calls in times of unexpected pressure’ (PECS Code of Practice 2020). The
1467 call handling agent (BT) will automatically divert calls to the buddy if unanswered by the home

1468 control room for a defined period.

1469 The extent of the support that a buddy arrangement provides may vary, but all will allow for
1470 emergency call taking and the transfer back to the home control of emergency call data.

1471 Where mobilising systems are suitably linked or other systems provided, it may be possible for the
1472 redistribution of emergency calls to a buddy without the intervention of the call handling agent.

1473 It is essential that the fire control commander is aware of any such arrangements and can identify
1474 when calls are being handled by a buddy emergency control room. They must ensure the
1475 mobilisation of resources is carried out and that the buddy is informed of any specific advice or
1476 survival guidance to be passed to emergency callers.

1477 During periods of exceptionally high demand the number of emergency calls may exceed the
1478 capacity of the home fire control and the buddy arrangement. In such instances the call handling
1479 agent may redistribute emergency calls to emergency control rooms beyond the pre-nominated
1480 buddy arrangement, and this may include passing calls to Police and Ambulance control rooms.

1481 When this becomes necessary the call handling agent will inform the home fire control using their
1482 critical contact number. The fire control commander should then consider the use of national and
1483 regional talk groups to share situational awareness, which will include but is not limited to, any
1484 change in survival guidance.

1485 The call handling agent may also use the critical contact number if there are extended delays in calls
1486 being answered by fire control or where there are delays and they have an exceptionally critical call
1487 waiting.

1488 *STRATEGIC ACTIONS*

1489 Fire and rescue services should:

- 1490 • Establish the command competencies, training, validation and revalidation required for
1491 additional call handling capacity: emergency call redistribution
- 1492 • Provide the call handling agent with a critical contact number for fire control
- 1493 • Consider the use of buddy arrangements to manage the redistribution of emergency calls
- 1494 • Provide the call handling agent with details of buddy arrangements
- 1495 • Provide access for fire control personnel to regional and national talk groups

1496 *TACTICAL ACTIONS*

1497 Fire control commanders should:

- 1498 • Understand the emergency call redistribution methods that may be used by the call handling
1499 agent and when they may be used
- 1500 • Understand the buddy arrangements in place and the process for receiving or handing back
1501 incident data

- 1502 • Identify when emergency calls are being handled by another fire control or other emergency
1503 control
- 1504 • Ensure situational awareness and any change to advice is shared with the pre-nominated
1505 buddy and other emergency control rooms
- 1506 • Ensure situational awareness is shared with operational incident commanders
- 1507 • Ensure all appropriate mobilising actions are carried out for emergency calls handled by a
1508 buddy or other emergency control room
- 1509 • Consider the use of national and regional talk groups to share situational awareness and any
1510 change to advice with other controls

1511 **Control Measure – Changes to call handling procedures by the call handling agent**

1512 *CONTROL MEASURE KNOWLEDGE*

1513 The Public Emergency Call Service (PECS) Code of Practice deals with the method of handling
1514 '999/112' public emergency telephone calls between the call handling agents and the emergency
1515 authorities. In addition to the procedures that will be followed when connecting calls to emergency
1516 control rooms, PECS also provides information regarding contingency arrangements. Fire and rescue
1517 services should therefore consider the PECS Code of Practice when developing policies, procedures
1518 and training for fire control personnel.

1519 In the event of excessive call volumes as a result of spate or spike conditions or a major incident
1520 the Call Handling Agent may be able to provide assistance including the redistribution of emergency
1521 calls received via 999/112 to a pre-nominated buddy control room, or by applying agreed call-filtering
1522 questions.

1523 The call handling agent may be contacted to assist with call queue or filtering arrangements and a
1524 statement agreed between fire control and the call handling agent for the duration of the incident or
1525 event in question.

1526 For example, on connecting a call the call handling agent may agree to say: "(EA name) is very busy
1527 with calls relating to (incident details) at (location). I will try to connect you".

1528 If specifically requested by a fire control trying to prioritise calls, for example where many flood-
1529 related calls are being received, the call handling agent may agree to ask further simple questions
1530 before connection in an effort to filter-out non-emergency cases on behalf of the fire control room.

1531 *STRATEGIC ACTIONS*

1532 Fire and rescue services should:

- 1533 • Establish the command competencies, training, validation and revalidation required for
1534 changes to call handling procedures by the call handling agent
- 1535 • Consider the PECS Code of Practice when developing policies, procedures and training for
1536 fire control personnel
- 1537 • Provide contact numbers for the Call Handling Agent with the appropriate level of priority

- 1538 • Provide information on the facilities available through Call Handling Agents (BT) for call
1539 filtering and redistribution

1540 *TACTICAL ACTIONS*

1541 Fire control commanders should:

- 1542 • Understand the additional call management assistance methods offered by the call handling
1543 agent
- 1544 • Consider the use of additional call management assistance methods offered by the call
1545 handling agent
- 1546 • Understand how to contact the call handling agent to request additional call management
1547 assistance

1548 **Hazard – Ineffective management of fire control**

1549 *HAZARD KNOWLEDGE*

1550 **Communication**

1551 Communication can be ineffective or fail when information is not shared at the right time or is not
1552 understood by the receiver. This can lead to:

- 1553 • Incorrect or inappropriate information being used to assess a situation, resulting in:
- 1554 ○ Poor individual situational awareness
- 1555 ○ Inconsistent shared situational awareness
- 1556 ○ A faulty perception of events unfolding
- 1557 ○ Wrong decisions being taken for the actual situation
- 1558 • Failure to co-ordinate team activities, causing task conflicts between personnel or other
1559 agencies
- 1560 • 'Freelancing' because of a breakdown in leadership and confidence
- 1561 • Increased risk of accidents because risk-critical information is not shared or understood

1562 Throughout all aspects of communication, fire and rescue services and their employees need to be
1563 aware of the potential for misuse of information, and mindful of the legal requirements placed on
1564 them, by legislation such as the Data Protection Act and the Freedom of Information Act.

1565 **Spans of control**

1566 Unless spans of control are maintained at manageable levels, fire control commanders may be
1567 overloaded with information, which may impact on:

- 1568 • Gaining effective situational awareness
- 1569 • Appropriate decision-making

- 1570 • Effective communication
- 1571 • Ability to maintain effective command of fire control

1572 Methods of sectorisation may be considered to support effective communication, effective fire
1573 control command and the management of activities and tasks.

1574 **Control measure – Effective communication**

1575 *CONTROL MEASURE KNOWLEDGE*

1576 Fire control commanders usually manage multiple incidents at any given time. They will lead their
1577 teams to manage and support multiple incidents and situations while also undertaking other fire
1578 control activities. Effective communication within the fire control team and with the incident
1579 grounds they support is therefore essential.

1580 Effective communication is fundamental to achieving successful and safe resolution of incidents. In
1581 fire control, it provides the fire control commander with knowledge about incidents, the situation
1582 and progress of tasks. Obtaining accurate and timely information is crucial to underpin situational
1583 awareness and subsequent decision-making. It helps the fire control commander perform their role
1584 in a confident and determined manner and to ensure that all incidents and associated fire control
1585 activities are supported safely and effectively.

1586 Communication also plays a vital role in co-ordinating activities, completing tasks and handover of
1587 command. Sharing accurate and timely information is also critical for helping others to have a
1588 common understanding of the situation, what is happening and what needs to happen next. Even
1589 the most effective plans will only work if the people putting them into practice understand them.

1590 As well as exchanging information, good communication helps to build relationships between
1591 people. These relationships are important so that people are effective when they carry out their
1592 tasks to resolve the incident. Fire control commanders should be aware that effective
1593 communication is essential for good leadership and makes it easier for people to follow instructions,
1594 understand briefings and have confidence in what is being stated.

1595 Effective communication should:

- 1596 • Provide information that is:
 - 1597 ○ Clear
 - 1598 ○ Relevant and concise
 - 1599 ○ Timely
- 1600 • Be easily understood
- 1601 • Be delivered confidently
- 1602 • Include active listening
- 1603 • Ensure verbal and non-verbal communications are aligned
- 1604 • Ensure assumptions are questioned

1605 Key principles should be considered in maintaining an effective communication strategy in fire
1606 control:

- 1607 • That information received in support of incidents and shared with an incident ground is
1608 accurate, appropriate and timely
- 1609 • That information is obtained from a reliable and credible source, or if not that it is checked
1610 and verified
- 1611 • That information received from an incident ground is recorded accurately using incident logs
- 1612 • That appropriate methods of communicating information are used if there are security
1613 implications, or the need to relay sensitive or distressing information
- 1614 • The appropriate recipients are provided with relevant information, via a suitable method
- 1615 • The relevance of the information

1616 A good flow of information is essential to ensure the effective management of fire control activities.
1617 The fire control commander should ensure they:

- 1618 • Gather information, issue instructions and receive situation reports
- 1619 • Ensure that information received is understood, including differences in terminology
- 1620 • Challenge information to confirm that it is current and valid
- 1621 • Identify conflicting information and confirm what is correct
- 1622 • Issue instructions to personnel
- 1623 • Receive situation reports from all incidents or ongoing activities
- 1624 • Assess and provide for the needs of other agencies
- 1625 • Brief personnel about the tasks they need to perform
- 1626 • Thoroughly brief personnel to share any safety critical information

1627 For multi-agency incidents the M/ETHANE message protocol should be used to exchange
1628 information about the incident with other responders and agencies' control rooms.

1629 Fire control commanders should ensure suitable arrangements for communications with operational
1630 incidents are established and maintained. At an incident it is usually the role of command support
1631 under the guidance of the incident commander to establish arrangements for communications,
1632 which will include communication with fire control.

1633 The fire control commander should consider the extent of the communications required to meet the
1634 activities of fire control, and this may include:

- 1635 • Ensuring effective communication and information flow between fire control personnel
- 1636 • Maintaining communications links with incidents grounds.
- 1637 • Ensuring radio channels and call signs are correctly assigned
- 1638 • Establishing communications with other agencies

- 1639 • Establishing communications with other control rooms
- 1640 • The use of talk groups
- 1641 • Requesting the support of a communications tactical adviser
- 1642 • Ensuring effective communication with other officers and personnel not at an incident
- 1643 ground
- 1644 • Ensuring the JESIP Control Room Supporting Principles are prioritised appropriately during
- 1645 multi-agency incidents

1646 **Effective handover**

1647 Ensuring there is an effective handover between fire control commanders is a crucial step in the
 1648 handing over of command. It is an important stage in the formation of the new fire control
 1649 commander’s situational awareness, which will be partially based on the situational awareness of
 1650 the current commander and will be further developed from the range of information that will be
 1651 gathered. Failure to conduct an effective handover can lead to poor situational awareness and can
 1652 result in inappropriate or ineffective decisions being made.

1653 There may be occasions where a more senior fire control manager or operational officer is called
 1654 upon and who may decide to take command. In such situations they should be briefed on current
 1655 situational awareness by the fire control commander. Where command of the fire control room is
 1656 handed over this should be made clear by both parties and incident logs updated where appropriate.

1657 Fire control commanders should ensure an effective handover at the change of each shift and that
 1658 fire control personnel are appropriately briefed. This may be achieved by one-to-one handover
 1659 between fire control personnel, team briefing or other suitable method, but must ensure that
 1660 information and situational awareness are shared effectively while also maintaining the activities of
 1661 the fire control function.

1662 Handovers should include:

- 1663 • Information on all ongoing incidents including command structure and communication lines
- 1664 • The most recent M/ETHANE messages received for ongoing incidents
- 1665 • Information on any other incidents which may have or require additional actions or which
- 1666 may generate social media or other interest from members of the public
- 1667 • Information on the resources currently deployed to incidents
- 1668 • Information on operational cover including resources at standby locations
- 1669 • Information on any other local, regional or national resources in use
- 1670 • Information on reports made to National Resilience Fire Control via the reporting tool
- 1671 • Information on any specific plans or arrangements for emergency call management

1672 *STRATEGIC ACTIONS*

1673 Fire and rescue services should:

- 1674 • Ensure methods are in place for effective handover of fire control command
- 1675 • Ensure there is resilience in operational communication strategies and equipment
- 1676 • Test the compatibility of communications equipment, systems and processes with
1677 neighbouring fire and rescue services and other agencies
- 1678 • Ensure that they have appropriate communications systems in place between fire control
1679 and incidents
- 1680 • Have contingency arrangements for reinstating operational communication, in the event of
1681 equipment or strategy failure

1682 *TACTICAL ACTIONS*

1683 Fire control commanders should:

- 1684 • Ensure communication with incident grounds is maintained
- 1685 • Ensure the exchange of information about the incident with the incident ground in a timely
1686 way
- 1687 • Ensure regular situation updates are provided to all responders
- 1688 • Ensure appropriate updates via the national reporting tool
- 1689 • Establish resilient telecommunications with other responding agencies and consider talk
1690 groups
- 1691 • Deliver clear, concise and timely briefings to personnel
- 1692 • Ensure the M/ETHANE message protocol is used to exchange information about the incident
1693 with other responders
- 1694 • Provide an effective handover when handing over command
- 1695 • Receive an effective handover when taking over command
- 1696 • Ensure an effective handover between fire control personnel
- 1697 • Ensure that an accurate record of information received is maintained

1698 **Control measure – Organisation of the fire control function**

1699 *CONTROL MEASURE KNOWLEDGE*

1700 Managing and supervising fire control personnel is an essential part of the safe system of work that
1701 encompasses all aspects of fire control activity. Incident command in the fire control context allows
1702 the fire control commander to adapt and to organise the resources available to them to deal with
1703 incidents safely and effectively.

1704 The incident command system provides the fire control commander with a framework to structure
1705 and organise fire control activity in a controlled manner. It is essential that the fire control
1706 commander carries out a continuous review of progress to maintain their situational awareness and
1707 that measures to support communication and the sharing of information are put in place. Taking
1708 these steps will prevent the fire control commander from becoming overloaded with information,
1709 which supports effective situational awareness and decision-making. This way the fire control
1710 commander can maintain control under conditions of high pressure and rapid change.

1711 The fire control commander should carry out continuous review and assessment of fire control
1712 workloads to organise their team effectively, taking into account the welfare needs of fire control
1713 personnel and the availability of additional support.

1714 **Sectorisation**

1715 Understanding the span of control concept is important when managing a large amount of activity
1716 and information. The fire control commander will usually be managing multiple incidents at any
1717 given time, and they may have a large team of fire control personnel passing information to them
1718 about different incidents or needing to gain their attention. Fire control commanders should
1719 prioritise the designation and delegation of specific tasks, communicating clearly and confirming
1720 understanding.

1721 To maintain manageable spans of control fire control commanders may consider methods of
1722 implementing sectorisation when planning the activities of the fire control function. A simple form
1723 of sectorisation may be achieved by allocating a task to specific fire control personnel. For example,
1724 two team members could be tasked with working through an action plan for an incident. In a more
1725 complex situation, they might deal with the allocation of a response to batches of incidents during
1726 sparse conditions. The designation of such tasks can support an effective reporting structure. Where
1727 possible the designation of responsibilities should be identified as part of an operational plan,
1728 however it is acknowledged that in some circumstances it is not possible to pre-plan. Any form of
1729 sectorisation in fire control should only be used if necessary and fire control commanders should
1730 keep the structure as simple as possible. In doing so, the potential barriers to the flow of
1731 information between the fire control commander, fire control personnel and operational incident
1732 commanders is reduced.

1733 The use of buddy emergency call handling arrangements may provide an additional method of
1734 sectorisation. The extent of what can be achieved will depend on the type of buddy arrangements
1735 and available technology. When considering the use of buddy arrangements as a form of
1736 sectorisation it is essential that appropriate methods of communication and resource mobilisation
1737 are agreed between partners and the effectiveness of the plan is monitored throughout the event or
1738 situation.

1739 Sectorisation may not be achievable due to reduced numbers of fire control personnel, for example
1740 in fire controls where team sizes are smaller. In such instances it is essential that the fire control
1741 commander makes an early assessment of the workload, selecting the most appropriate method to
1742 manage the situation.

1743 Even when tasks are delegated, the fire control commander remains responsible for overall incident
1744 management. They should remain focused on command and control, the use of resources, incident

1745 planning and the co-ordination of any sectorisation or delegation and designation of tasks.

1746 To support the scope of the work of fire control, fire and rescue services need to identify the roles
1747 likely to be performed by fire control personnel. These will include the level of skills and appropriate
1748 responsibilities for each fire control role and function.

1749 Establishing joint working protocols with neighbouring and buddy fire and rescue services, and other
1750 agencies, may help to support the sectorisation or designation of tasks during a larger scale or multi-
1751 agency incident. To ensure the flow of information and sharing of situational awareness, fire control
1752 personnel should also be aware of operational command team roles and functions and establish
1753 single points of contact through which information can be easily and quickly relayed.

1754

1755 *STRATEGIC ACTIONS*

1756 Fire and rescue services should:

- 1757 • Consider establishing joint working protocols with neighbouring and buddy emergency
1758 controls
- 1759 • Identify the roles and competencies required to deliver the fire control function

1760 *TACTICAL ACTIONS*

1761 Fire control commanders should:

- 1762 • Organise fire control using appropriate structure and personnel
- 1763 • Establish sectorisation or designation of tasks appropriate to the type, size and complexity of
1764 the incident or situation
- 1765 • Ensure fire control personnel understand the roles assigned to them and the allocation of
1766 tasks
- 1767 • Ensure that single points of contact with operational command teams for the sharing of
1768 information are established

1769 **Control measure – Specialist advice**

1770 *CONTROL MEASURE KNOWLEDGE*

1771 The types of incident or situation that are reported to fire control are many and varied, and as it is
1772 not possible for the fire control commander to have an in-depth knowledge of all types of incident,
1773 they may need to request advice from another member of their team, fire control manager,
1774 operational personnel, subject matter expert or tactical advisor. It is therefore essential that fire
1775 control commanders can recognise such situations and select the most appropriate solutions.

1776 The extent and urgency for requesting specialist advice will be dictated by the type and complexity
1777 of the incident or situation. The amount, quantity and quality of information required will depend on
1778 the incident or situation. Fire and rescue services need to provide fire control personnel with

1779 accurate and current information.

1780 **Subject matter expert**

1781 A subject-matter expert (SME) is a person who is an authority in a particular area or topic. Fire
1782 control commanders should ensure, so far as practicable, that the individual is an expert in the
1783 relevant field.

1784 **Subject matter adviser**

1785 Subject matter advisers (SMA) are members of the fire and rescue service who regularly work with
1786 National Resilience capabilities. The SMA will provide detailed tactical capability advice to an
1787 incident commander.

1788 **Tactical adviser**

1789 Fire control commanders can request the support of tactical advisers (TacAds); they are trained and
1790 recognised specialists with specific references within local or National Resilience capabilities. They
1791 are available to provide advice and support to any incident irrespective of location. However, their
1792 usual role is within their host fire and rescue service or control room.

1793 A tactical adviser has in-depth knowledge from a business and organisational perspective, which can
1794 significantly enhance performance when shared with others.

1795 Tactical advisers are currently available from the following fields:

- 1796 • National Inter-agency Liaison Officer (NILO)
- 1797 • Urban search and rescue (USAR)
- 1798 • High volume pumps (HVP)
- 1799 • Flood response
- 1800 • Hazardous materials
- 1801 • Chemical, Biological, Radioactive, Nuclear (explosive) (CBRN(e))
- 1802 • Radiation protection
- 1803 • Marine
- 1804 • Wildfires
- 1805 • Waste fires
- 1806 • Communications
- 1807 • Fire investigation

1808 When consulting a tactical adviser or other qualified person, the fire control commander should
1809 ensure that their decision-making rationale and any following actions and information is recorded
1810 within the incident log.

1811 When nominating individuals to receive specialist training fire and rescue services should consider

1812 the nomination of fire control managers in the specific fields that may enhance the resilience of the
1813 fire and rescue service and the service that the fire control function provides, such as NILO and
1814 Communications Tactical Adviser roles. This will also provide an enhanced level of support to
1815 operational incident commanders and to other agencies during major incidents and periods of joint
1816 organisational working.

1817 *STRATEGIC ACTIONS*

1818 Fire and rescue services should:

- 1819 • Develop arrangements and protocols with identified sources of specialist advice
- 1820 • Consider nominating fire control subject matter experts to appropriate tactical adviser roles
- 1821 • Maintain the details of sources of specialist advice and know how to request their
1822 attendance
- 1823 • Ensure personnel are aware of the types of specialist advice available

1824 *TACTICAL ACTIONS*

1825 Fire control commanders should:

- 1826 • Understand when and how to request specialist advice
- 1827 • Ensure specialist advisers are fully briefed on the aims and objectives for the incident or
1828 situation
- 1829 • Check for understanding of the advice received, and record if appropriate
- 1830 • Ensure incident logs are updated with all actions and decisions
- 1831 • Ensure information is shared with the incident commander when appropriate

1832 **Control measure – Command roles and responsibilities**

1833 *CONTROL MEASURE KNOWLEDGE*

1834 It is important to have clearly-defined command roles and responsibilities for all incidents and
1835 situations in fire control.

1836 The declaration of a major incident may instigate the requirement for additional resources from
1837 multiple agencies and hence additional strategic management which would be established both at
1838 an incident ground and at remote locations and this may have an impact upon the roles and
1839 responsibilities within fire control. Following the declaration of a major incident the fire control
1840 commander may be required to participate in briefings or conference calls, and so may delegate the
1841 supervision of the activity of the fire control function to another member of their team.

1842 **Levels of command**

1843 It is the responsibility of fire and rescue services to ensure that fire control personnel achieve and
1844 maintain command competence appropriate to their role.

1845 **Incident command system**

1846 The incident command system provides a structure that ensures a competent person is responsible
1847 for command and control at operational, tactical and strategic levels. Fire control personnel should
1848 be appropriately supervised to maintain the safety and effectiveness of the fire control function.

1849 In fire control, the fire control commander is the person nominated to take charge of the fire control
1850 function and is usually the person on duty in the fire control room holding the highest rank. They
1851 may delegate authority for some of the activities of the fire control function, including responsibility
1852 for tasks. However, the fire control commander remains the nominated competent and responsible
1853 person, including having responsibility for the mobilisation of resources and for the health and safety
1854 of fire control personnel.

1855 During more complex incidents or situations the fire control commander may call upon a more
1856 senior person for support and advice. This may be the fire control manager or an operational officer.
1857 Where this happens the more senior person should assess the situation before deciding to assume
1858 command of fire control. It may be more important to maintain continuity of fire control command,
1859 rather than automatically handing this over on the arrival of a more senior officer. This arrangement
1860 will allow the senior officer to take a variety of other roles, including providing tactical advice,
1861 mentoring and monitoring. When making this decision, the on-coming senior officer should assess
1862 whether the existing fire control commander is sufficiently capable to remain in that role, based on
1863 the type, size and complexity of the incident or situation.

1864 Transfers of command in fire control should be kept to the minimum needed to resolve the incident
1865 or situation and to manage welfare. The transfer of command should be a formal handover process
1866 that is acknowledged and communicated. This is equally important when an incident or situation
1867 escalates or scales down.

1868 All fire control personnel should be informed of changes of fire control commander. This should be
1869 recorded on the incident or decision log as appropriate. There should be no doubt as to who is in
1870 command.

1871 **Interoperability and intraoperability**

1872 Multi-agency interoperability is essential for incidents of all sizes. The [Joint Emergency Services](#)
1873 [Interoperability Principles Joint Doctrine](#) aims to promote greater consistency across emergency
1874 services. This includes the use of key terms and common terminology, which helps to develop a
1875 common understanding of the situation. Also refer to the [UK Civil Protection Lexicon](#)

1876 Emergency control rooms play a vital role in managing the early stages of a multi-agency incident.
1877 The JESIP Joint Doctrine provides specific control room guidance in the interoperability framework
1878 and builds consistency into the procedures and working practices of emergency service control
1879 rooms. The JESIP Control Room Supporting Principles for joint working are divided into three
1880 sections:

- 1881 • Communications
- 1882 • Shared situational awareness and joint understanding of risk
- 1883 • Co-ordination and co-location

1884 Emergency control rooms generally operate from separate fixed locations and therefore cannot
1885 feasibly co-locate. They can, however, help in co-locating responders and commanders by jointly
1886 agreeing the initial multi-agency rendezvous points.

1887 There is no legislation that states the primacy of one agency over another. The Joint Doctrine gives
1888 further guidance on co-ordination between emergency services.

1889 The key principles of effective joint working are:

- 1890 • Co-location
- 1891 • Communication
- 1892 • Co-ordination
- 1893 • Joint understanding of risk
- 1894 • Shared situational awareness

1895 A number of commercial or industrial sites will have their own fire and rescue services, for example,
1896 airports or oil refineries. Fire and rescue services should develop local arrangements that define the
1897 roles and responsibilities of each agency attending an emergency, for example, transfer of
1898 command. Fire control personnel should be made aware of any such arrangements and methods for
1899 communication between fire control and the commercial or industrial fire and rescue service should
1900 be considered, together with any specific arrangements for the mobilisation of resources to the site.

1901 It is important that fire and rescue services can provide an effective response to local, cross-border
1902 and national incidents. The national frameworks support the principles of national resilience. Fire
1903 and rescue services need an understanding of resources and capabilities available to them.

1904 Pre-planning should include developing local arrangements with neighbouring fire and rescue
1905 services and other agencies. Those arrangements may assign responsibilities or primacy to a lead
1906 agency. They might base this on the nature of the incident or other relevant factors. This may need
1907 to change to reflect the changing phases of an incident. To ensure effective communication and flow
1908 of information between agencies, it is essential that the fire control commander is made aware of
1909 any such arrangements and that they are communicated to fire control personnel. Pre-planning
1910 should also include the development of arrangements for emergency call taking and the sharing of
1911 situational awareness with other fire control rooms, neighbouring fire and rescue services and other
1912 agencies.

1913 Cross-border and multi-agency arrangements should be periodically tested under realistic
1914 conditions. Such tests must include fire control and consider all aspects of the fire control function in
1915 processing and managing incidents of this type. The outcomes of these exercises should be used to
1916 continuously improve future performance.

1917 Fire and rescue services should ensure that policies, procedures and training for fire control
1918 personnel consider the Control Room Supporting Principles of the JESIP Joint Doctrine. They should
1919 identify joint training opportunities with other emergency service controls and responders. Joint
1920 training is valuable in helping fire control personnel practice the setting up and use of
1921 communications methods such as talk-groups and conference calls to share situational awareness.

1922 This will help to avoid confusion during incidents and to develop teamwork and interpersonal
1923 communication.

1924 *STRATEGIC ACTIONS*

1925 Fire and rescue services should:

- 1926 • Develop local arrangements with neighbouring and buddy fire and rescue services and other
1927 agencies, that define command roles, responsibilities and expectations
- 1928 • Ensure that JESIP principles for command roles and responsibilities have been adopted and
1929 embedded in procedures
- 1930 • Ensure that JESIP Control Room Supporting Principles have been adopted and embedded in
1931 procedures
- 1932 • Ensure the fire control is included in cross-border and multi-agency exercises and training
1933 events

1934 *TACTICAL ACTIONS*

1935 Fire control commanders should:

- 1936 • Designate tasks and communicate to other control rooms and agencies as appropriate.
- 1937 • Ensure a formal handover process is used whenever command of fire control is transferred
- 1938 • Ensure all appropriate personnel are informed of any change of fire control commander
- 1939 • Record the details of the transfer of command within incident logs
- 1940 • Consider the JESIP principles for command arrangements at all multi-agency incidents
- 1941 • Ensure the JESIP Control Room Supporting Principles are considered during all multi-agency
1942 incidents

1943 **Hazard – Ineffective safety management**

1944 *HAZARD KNOWLEDGE*

1945 In planning, organising and preparing for the safe resolution of incidents, a Fire and Rescue Authority
1946 must comply with legal requirements to ensure the health, safety and welfare of their employees
1947 and the health and safety of others while ensuring an effective emergency service.

1948 The ability of fire control personnel to operate safely with appropriate levels of supervision is
1949 essential to the delivery of the fire control function that receives calls, manages the first stage of
1950 incident intelligence, mobilises operational crews to incidents and provides operational crews with
1951 safety critical support throughout the incidents they attend.

1952 It is essential that fire control commanders maintain an understanding of all activities of the fire
1953 control function and ensure the ability of fire control personnel to respond to the activity in a safe
1954 manner. They should consider the fire control personnel available and the methods available to

1955 them to achieve additional capacity to safely and effectively prioritise and manage all fire control
1956 activity. It is also essential in carrying out their assessment of call volumes and workloads to
1957 consider their own personal resilience and welfare arrangements for fire control personnel.

1958 **Control measure – Positive safety culture**

1959 *CONTROL MEASURE KNOWLEDGE*

1960 The effective delivery of the fire control function is essential to ensure support of the application of
1961 health and safety law and regulations at operational incidents.

1962 The fire and rescue service has developed a strong culture of safety through policies which support
1963 the application of health and safety law and regulations to the incident ground. This has been
1964 achieved in consultation with, and with the assistance of, the Health and Safety Executive.

1965 A culture that encourages incident commanders to act in accordance with the intentions of the
1966 Health and Safety Executive publication '[Striking the balance between operational and health and](#)
1967 [safety duties in the Fire and Rescue Service](#)' should be promoted. Fire and rescue services should be
1968 aware this can be undermined by the introduction of procedures that have restrictive elements,
1969 which prevent incident commanders from being able to apply their professional judgement.

1970 To promote a positive operational safety culture, fire and rescue service operational risk principles
1971 have been developed. All personnel should be made aware of these principles, which should be
1972 considered as a guide to making and managing risk-critical decisions during incidents:

1973 Principle 1: A willingness to make decisions in conditions of uncertainty is a core need for all
1974 members of the fire and rescue service.

1975 Principle 2: The primary consideration for making decisions is the safety of individuals and
1976 communities.

1977 Principle 3: Risk acceptance involves judgment and balance, with decision makers required to
1978 consider the value and likelihood of the possible benefits of a particular decision against the
1979 seriousness and likelihood of the possible harm.

1980 Principle 4: Harm can never be totally prevented. Risk-critical decisions should therefore be judged
1981 by the quality of the decision-making, not by the outcome.

1982 Principle 5: To reduce risk aversion, improve decision-making and avoid decision traps, a culture is
1983 required that learns from successes and failures. Good application of risk management which allows
1984 for positive operational outcomes should be identified, celebrated and shared, preferably through
1985 operational learning and debrief of outcomes.

1986 Members of the fire and rescue service who make decisions consistent with these principles should
1987 receive the encouragement, approval and support of their organisation.

1988 Fire and rescue services should recognise that every incident and situation will present its own
1989 challenges. Its incident commanders, command teams, fire control commanders and fire control
1990 personnel will need to be able to use knowledge, skills, systems and equipment to bring the incident

- 1991 to a safe conclusion.
- 1992 Fire control commanders have a responsibility to promote a positive safety culture through:
- 1993 • Safe systems of work
- 1994 • Appropriate supervision
- 1995 • Effective communication
- 1996 *STRATEGIC ACTIONS*
- 1997 Fire and rescue services should:
- 1998 • Provide the necessary systems and equipment to safeguard the safety and welfare of fire
1999 control personnel
- 2000 • Ensure all personnel responsible for the management of health, safety and welfare are
2001 aware of their responsibilities and the means for discharging them
- 2002 *TACTICAL ACTIONS*
- 2003 Fire control commanders should:
- 2004 • Promote a positive safety culture during all fire control activities
- 2005 All fire control personnel must:
- 2006 • Understand their responsibilities within health and safety regulations
- 2007 **Control measure – Risk assessment of fire control activities**
- 2008 *CONTROL MEASURE KNOWLEDGE*
- 2009 The law requires fire and rescue services to assess and reduce the risk to personnel as far as is
2010 reasonably practicable. As well as this duty of care to fire and rescue service personnel, there is also
2011 a duty to safeguard others.
- 2012 The objectives for fire and rescue services are to resolve incidents with minimal impact to the
2013 community, and to prevent or minimise harm to people and the environment.
- 2014 Fire control personnel should carry out the process of continuous risk assessment during all aspects
2015 of fire control activity. This will ensure that appropriate resources are mobilised to incidents based
2016 on situational awareness, response plans and professional judgement, and that fire control
2017 resources are appropriate to ensure delivery of the fire control function while considering fire
2018 control personnel welfare.
- 2019 The fire control commander should ensure that the risk critical activities of fire control are prioritised
2020 and allocated appropriately while also considering the other activities required of the fire control
2021 function. They should ensure appropriate methods are used to share situational awareness with
2022 incident commanders and that incident logs are updated appropriately.

2023 It is essential that radio operation and the monitoring of national and regional talk groups is
2024 maintained. Incident ground and firefighter safety relies on this link to ensure appropriate resources
2025 can be requested, including in the event of a firefighter emergency or water emergency. The
2026 monitoring of national and regional talk groups allows resilience in the sharing of situational
2027 awareness between fire control and other emergency controls, and so should be prioritised
2028 appropriately.

2029 When deciding upon pre-determined attendances and level of response to incidents, fire and rescue
2030 services will use task analyses or similar appropriate methodology to ensure that the level of
2031 response fulfils all the requirements of the incident while also considering the safety of firefighters
2032 and members of the public. It is essential that fire control personnel consider this when applying
2033 dynamic mobilising techniques, as this may have an impact on the safety of firefighters and
2034 members of the public.

2035 The fire control commander should continually assess fire control activity, considering the varying
2036 levels of skills and experience of fire control personnel. All fire control personnel should understand
2037 and be aware of their own abilities and limitations, to assess a situation and know how and when to
2038 request additional support or supervision.

2039 Emergency call handling and management can be very stressful and at times traumatic, and fire
2040 control personnel should be offered access to appropriate methods of post incident support.

2041 The needs of individuals must also be understood and considered when planning activities to ensure
2042 appropriate rest and meal breaks are included. If this is over-looked it may lead to poor
2043 communication and decision making and a breakdown in the effectiveness of the fire control
2044 function.

2045 Where sustained increased fire control activity is anticipated, such as during a major incident or
2046 spate conditions as a result of extreme weather, the welfare needs of personnel should be
2047 considered when planning crewing arrangements. It is essential that the fire control commander
2048 considers their own welfare needs in addition to those of their team members.

2049 *STRATEGIC ACTIONS*

2050 Fire and rescue services should:

- 2051 • Ensure systems and methods are in place to support the carrying out, sharing and recording
2052 of risk assessments
- 2053 • Ensure fire control personnel can access appropriate post incident support mechanisms
- 2054 • Provide fire control personnel with access to appropriate rest facilities

2055 *TACTICAL ACTIONS*

2056 Fire control commanders must:

- 2057 • Carry out continuous review of their risk assessment using situational awareness gathered
2058 throughout fire control activity

- 2059 • Ensure that information is appropriately communicated and recorded on incident logs,
2060 including confirmation of it being shared with an incident commander

2061

2062 Fire control commanders should:

- 2063 • Ensure that all fire control personnel are appropriately briefed on any changes to situational
2064 awareness and plans for the resolution of fire control activities
- 2065 • Share situational awareness with incident commanders
- 2066 • Ensure suitable arrangements are made for rest and meal breaks for fire control personnel
- 2067 • Consider call volumes and potential for prolonged sustained fire control activity when
2068 planning crewing arrangements
- 2069 • Monitor the welfare of fire control personnel and signpost to post-incident support
2070 mechanisms when appropriate

2071 **Control measure – Emergency call supervision**

2072 *CONTROL MEASURE KNOWLEDGE*

2073 Emergency calls are received in various ways and sometimes under difficult situations. Calls from the
2074 public can be challenging if not handled correctly. Poorly handled calls can delay resources attending
2075 an incident putting members of the public at risk.

2076 To avoid delay and to ensure accurate mobilisation of resources, call handling supervision may be
2077 required by fire control personnel. Call handling supervision may include visual or audio monitoring,
2078 or both, of the handling of an emergency call, by the fire control commander or another supervisory
2079 manager or suitably experienced member of the team.

2080 During the supervision of an emergency call the fire control commander or other member of the
2081 team may provide prompts and support to fire control personnel when needed, for example by
2082 assisting with the location of the incident, advising on the questioning of a caller or assisting with the
2083 allocation and mobilisation of appropriate resources. This may be necessary during any emergency
2084 call, but particularly in more complex situations such as fire survival guidance calls.

2085 It is important that appropriate methods of communication are used when supervising emergency
2086 calls. Fire control personnel should be provided with a level of support that is appropriate to their
2087 level of experience and competence and which does not delay the gathering of information or
2088 prevent the building of rapport with the caller.

2089 The development of all fire control personnel will continue through exposure to a variety of
2090 incidents, situations and continuous training. Fire and rescue services should have processes in place
2091 to assess the development of fire control personnel to decide when they are considered to have
2092 acquired the appropriate knowledge, skills and understanding to deal with all stages of an
2093 emergency call. This includes mobilising resources without direct supervision.

2094 Fire control commanders should be aware of the stages of development, skills and experience of all
2095 fire control personnel they work with and ensure that appropriate call handling supervision is
2096 applied when necessary.

2097 The need for additional monitoring and supervision of the work of fire control personnel in
2098 development or during acquisition of skills training should be considered, and appropriate methods
2099 of support put in place. The method of support selected will depend on the individual circumstances,
2100 but may include:

- 2101 • Audio and visual monitoring of emergency call handling
- 2102 • Audio and visual monitoring of other work activities
- 2103 • Training activities to support learning and development
- 2104 • Mentoring activities to support learning and development

2105 Where fire control personnel are undergoing the initial acquisition of skills phase of their training, or
2106 are otherwise deemed not yet competent, the fire control commander should ensure appropriate
2107 emergency call supervision is considered.

2108 *STRATEGIC ACTIONS*

2109 Fire and rescue services should:

- 2110 • Provide means for audio and visual supervisory monitoring of emergency calls

2111 *TACTICAL ACTIONS*

2112 Fire control officers in charge should:

- 2113 • Be aware of the levels of skills and experience of fire control personnel
- 2114 • Ensure appropriate methods are in place for emergency call handling supervision to be
2115 requested by fire control personnel
- 2116 • Ensure emergency call handling supervision is provided when appropriate
- 2117 • Ensure appropriate methods of communication during emergency call supervision

2118 Fire control personnel should:

- 2119 • Understand how to alert the fire control commander or other team member to a need for
2120 additional emergency call handling supervision
- 2121 • Take responsibility for their own learning and development

2122 **Control measure – Hold debriefing or post-incident reviews**

2123 *CONTROL MEASURE KNOWLEDGE*

2124 Debriefing, also referred to as post incident review, can be formal or informal. Debriefing can range
2125 from 'hot debriefs', which occur directly after the incident, to large multi-agency debriefs or a public
2126 inquiry following major incidents. They are an important part of improving personal and

2127 organisational performance. They should take place whenever there is an opportunity to improve
2128 service delivery. Active monitoring during fire control activity can inform and support this process.

2129 Due to the scope and nature of fire control activity it may be appropriate to consider holding
2130 debriefs following periods of spate or spike conditions or following business continuity events such
2131 as a loss of mobilising system or other situations resulting in the use of fallback facilities.

2132 Structured debriefs should be used to gain operational intelligence and safety-related information
2133 obtained during emergency call management and subsequent information gathering.

2134 Debriefing forms an essential part of the management of health and safety. In fire control debriefing
2135 will identify any significant information or lessons learned. Whenever possible, the fire control
2136 commander should debrief fire control personnel as soon after the incident or situation as is
2137 practicable. Systems of work, equipment, PPE and training can all be improved as part of this
2138 performance management system. The Health and Safety Executive (HSE) publication, [Managing for
2139 Health and Safety \(HSG65\)](#), provides further guidance on the principles of effective health and safety
2140 management in the workplace.

2141 Debriefing is an important part of reviewing and improving performance. There should be a debrief
2142 whenever there is a chance to improve standards of service delivery. Fire control commanders
2143 should choose an appropriate format for the review. They should conduct it in a way which
2144 encourages open, supportive and constructive discussion. If the review covers individual
2145 performance, discuss it against the standards for that role and acknowledge good performance and
2146 conduct worthy of merit. Fire control commanders should also carry out a process of self-reflection
2147 on their own performance during incidents and fire control activity.

2148 Debriefs should be used to review the performance, decisions and actions of individuals and teams
2149 against relevant standards with effective performance and meritorious conduct being acknowledged
2150 where appropriate. Debriefs can be used to highlight any unconventional system or procedures used
2151 that were successful or made the working environment or situation safer. The recording, monitoring
2152 and review of incident debriefs and the outcome of investigations can support the identification of
2153 trends to support future learning.

2154 Considerations should include whether existing information held about premises or locations should
2155 be reviewed, or whether there is a need to add a new premises or locations to mobilising system
2156 records.

2157 Incident reviews may also support National Operational Learning; for further information refer to
2158 [National Operational Learning: Good practice guide for fire and rescue services.](#)

2159 *STRATEGIC ACTIONS*

2160 Fire and rescue services should:

- 2161 • Have post-incident debriefing procedures suitable to a range of incident sizes that consider
2162 multi-agency involvement and the fire control room at all levels
- 2163 • Provide methods to facilitate debriefing in fire control

- 2164 • Promote and support operational learning at local, regional and national levels
- 2165 • Effectively communicate lessons learned from debriefs and operational learning to relevant
- 2166 personnel

2167 *TACTICAL ACTIONS*

2168 Fire control commanders should:

- 2169 • Conduct a structured debrief at a level appropriate to the incident or event
- 2170 • Record and share significant findings from incident debriefs

2171 Fire control personnel should:

- 2172 • Undertake a post-incident process of self-reflection on their performance in resolving an
- 2173 incident
- 2174 • Participate in, and be receptive to, operational learning
